grounded in theory.*

vs

vs

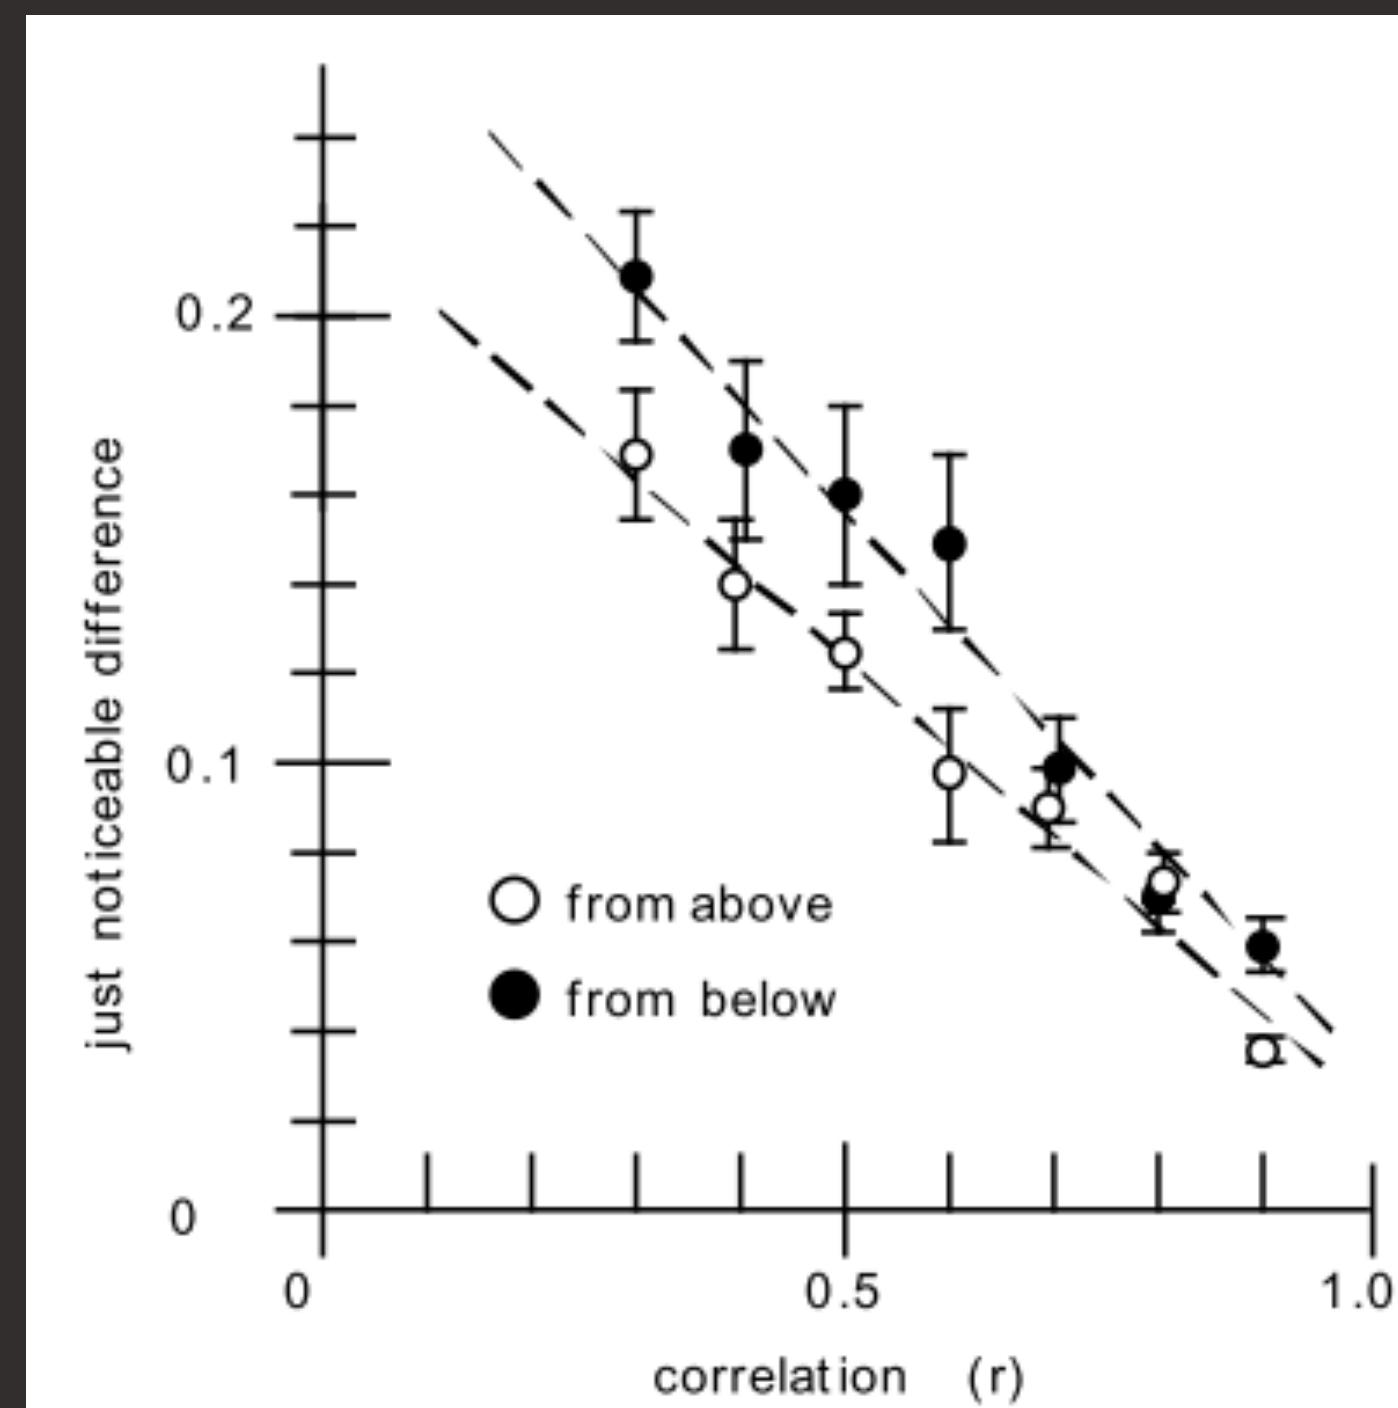

A model grounded in theory:

Ron Rensink, Gideon Baldridge (2010)

The Perception of Correlation in Scatterplots

- *Used psychophysiological methodologies.*

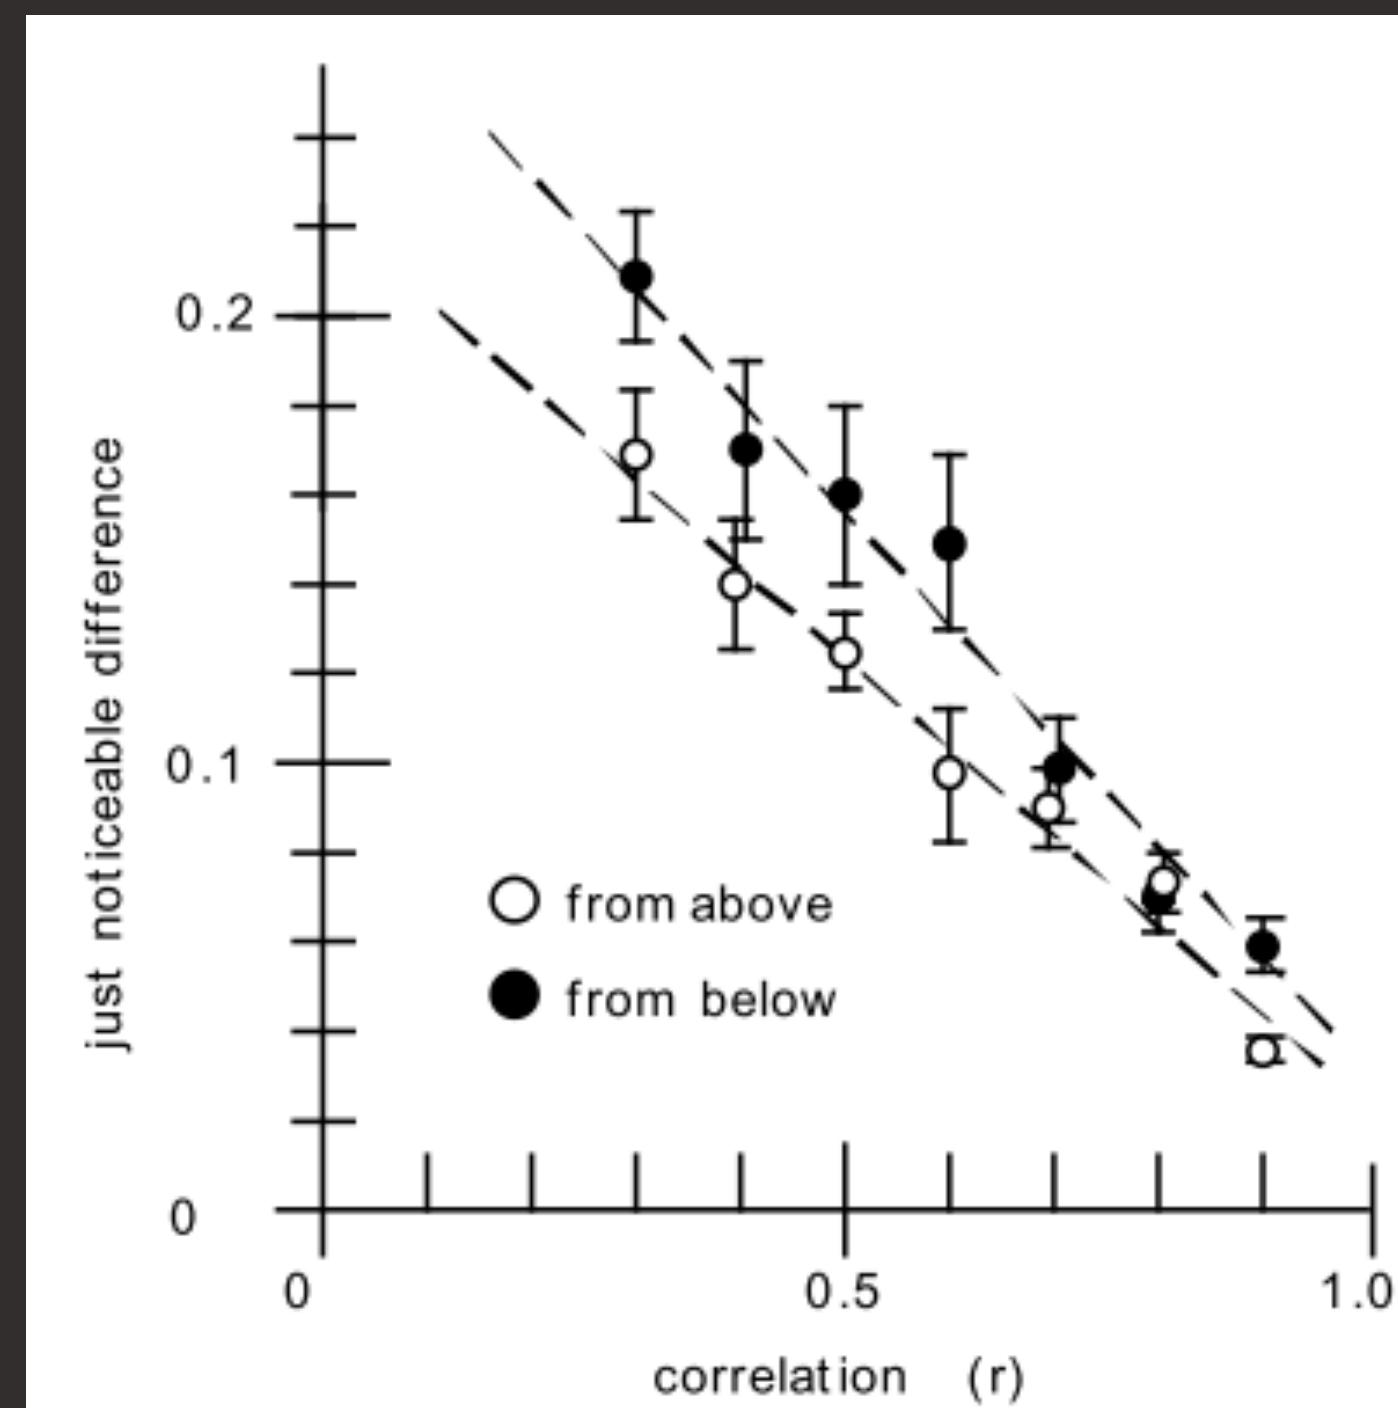

A model grounded in theory:

Ron Rensink, Gideon Baldridge (2010)

The Perception of Correlation in Scatterplots

- *Used psychophysiological methodologies.*
- *Inferred just-noticeable differences for scatterplots depicting positive correlations.*

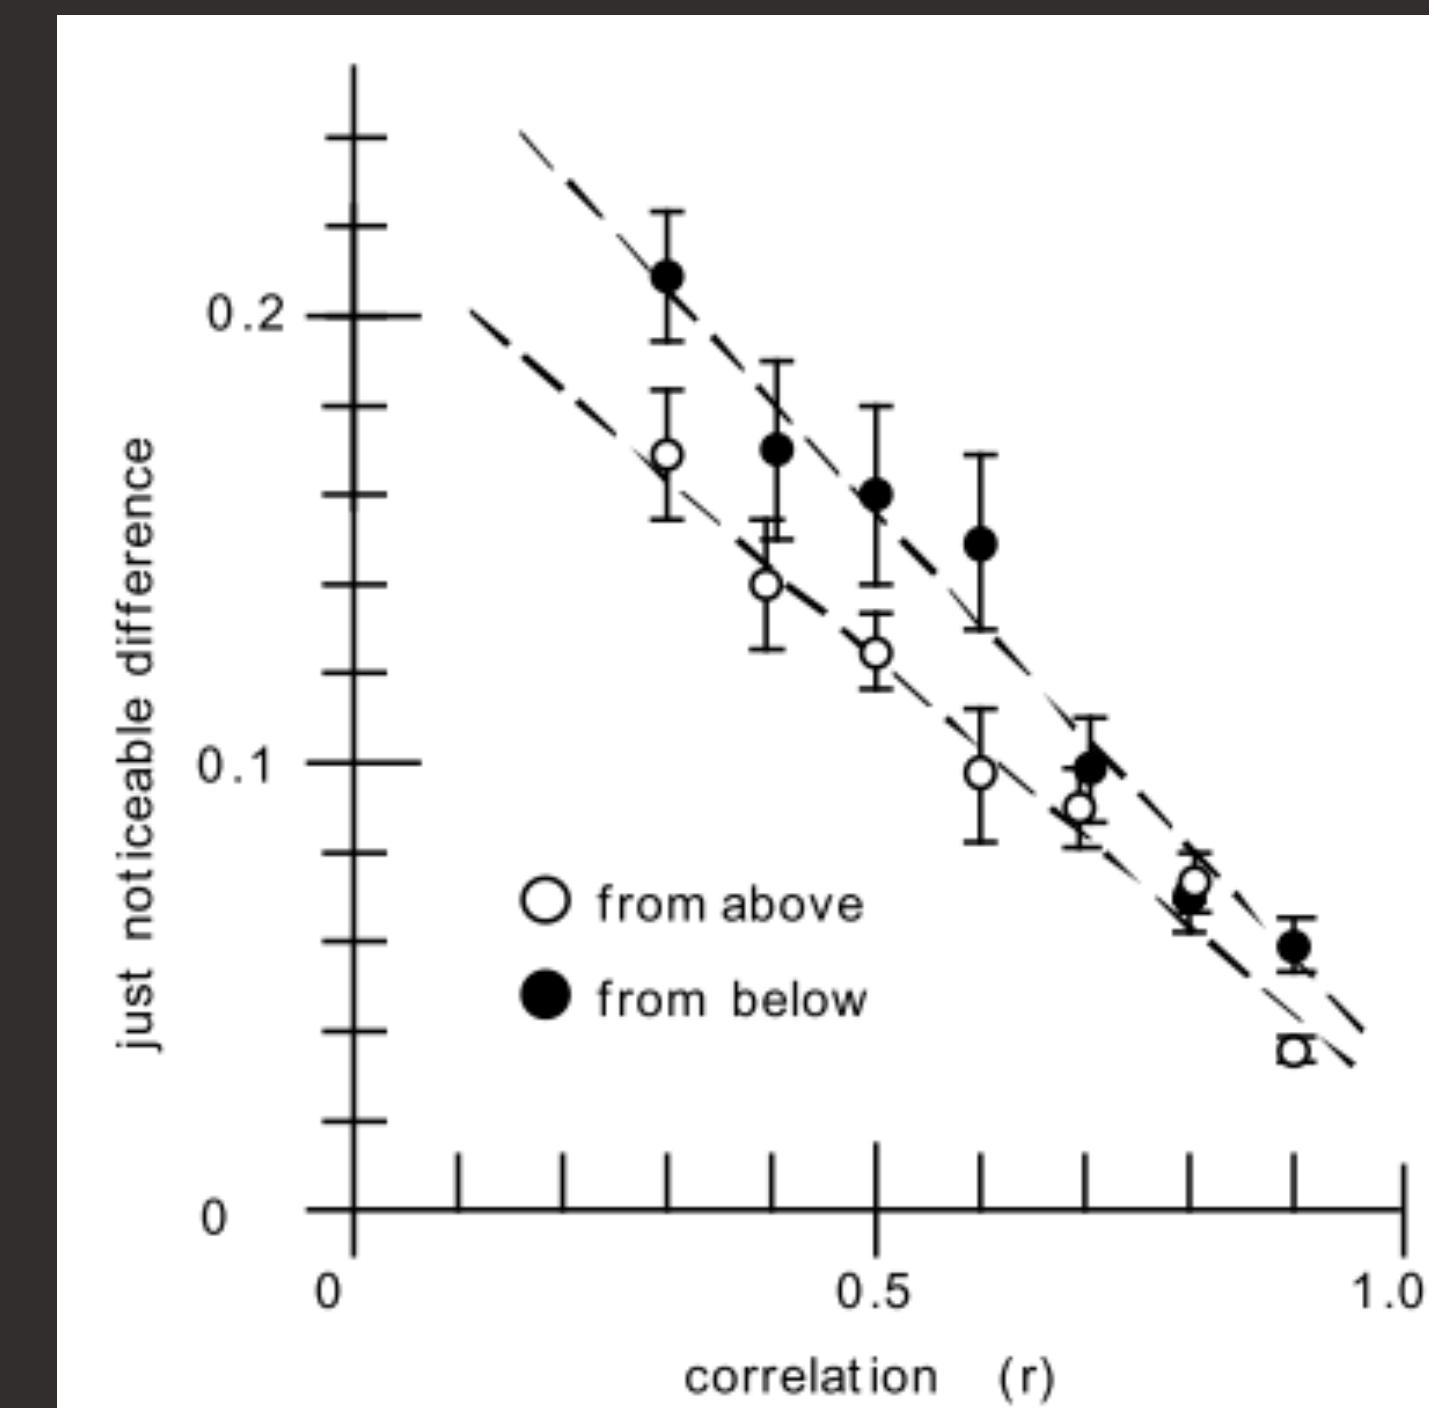

A model grounded in theory:

Ron Rensink, Gideon Baldridge (2010)

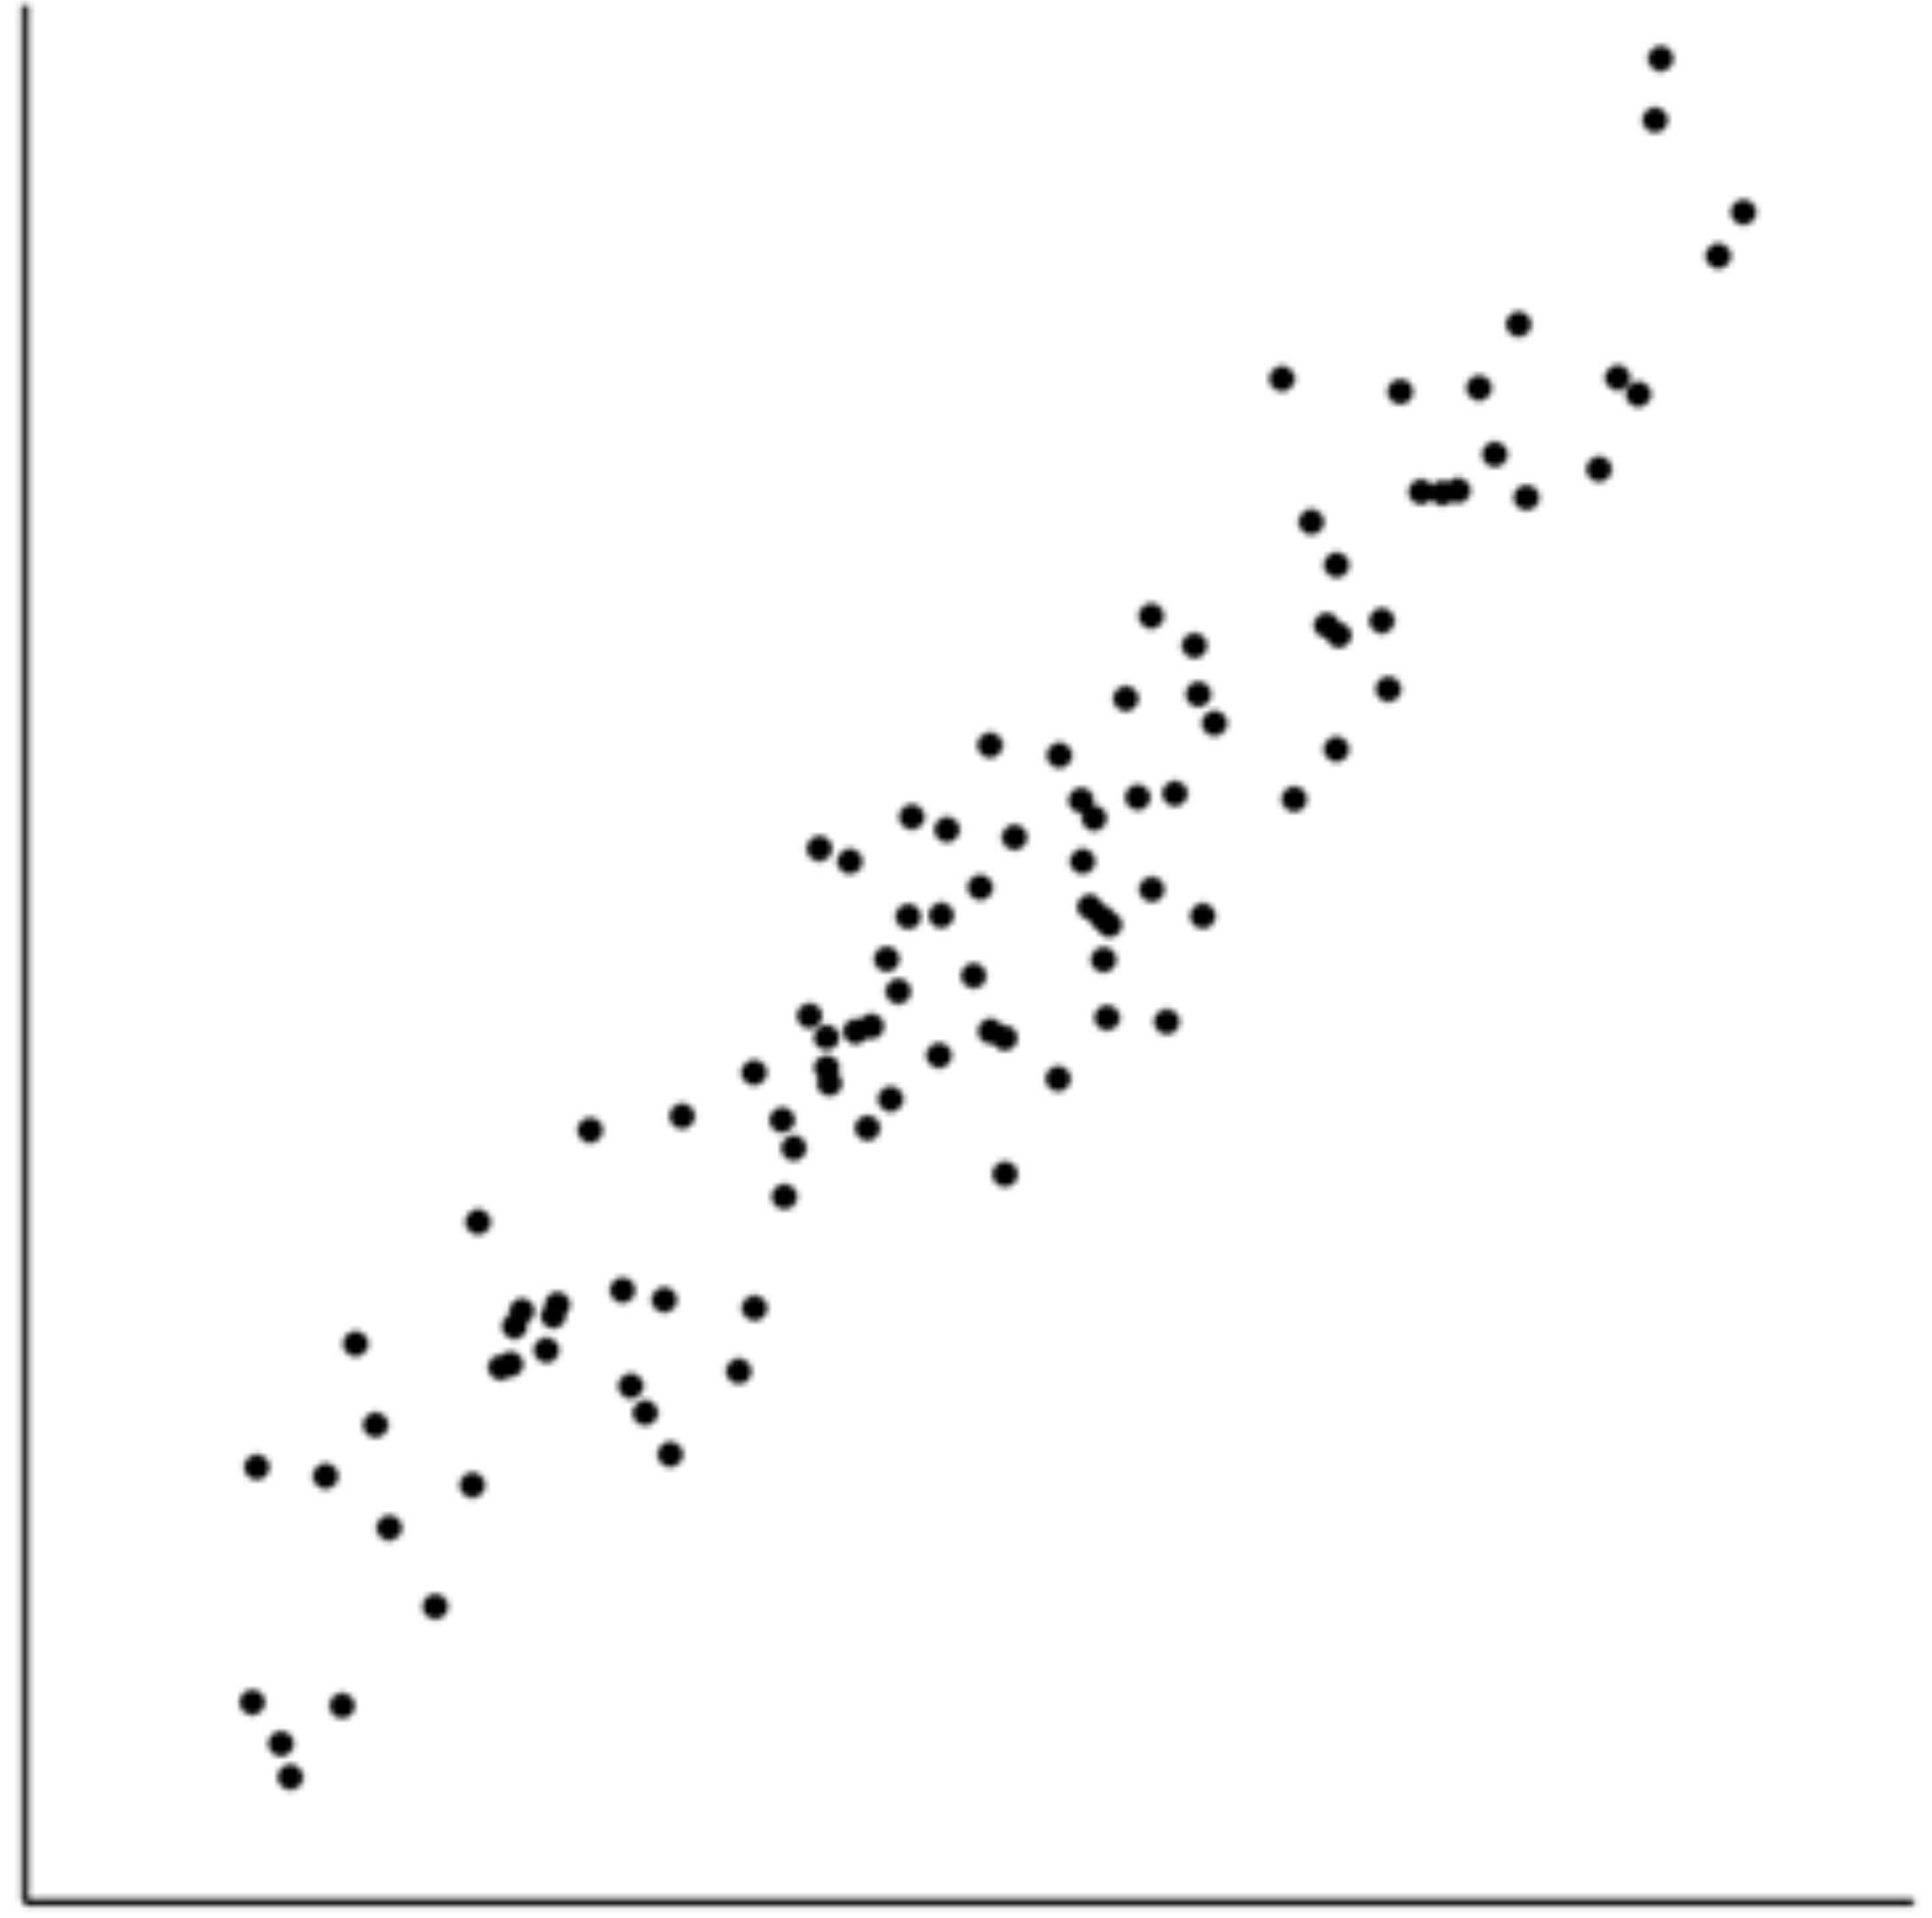

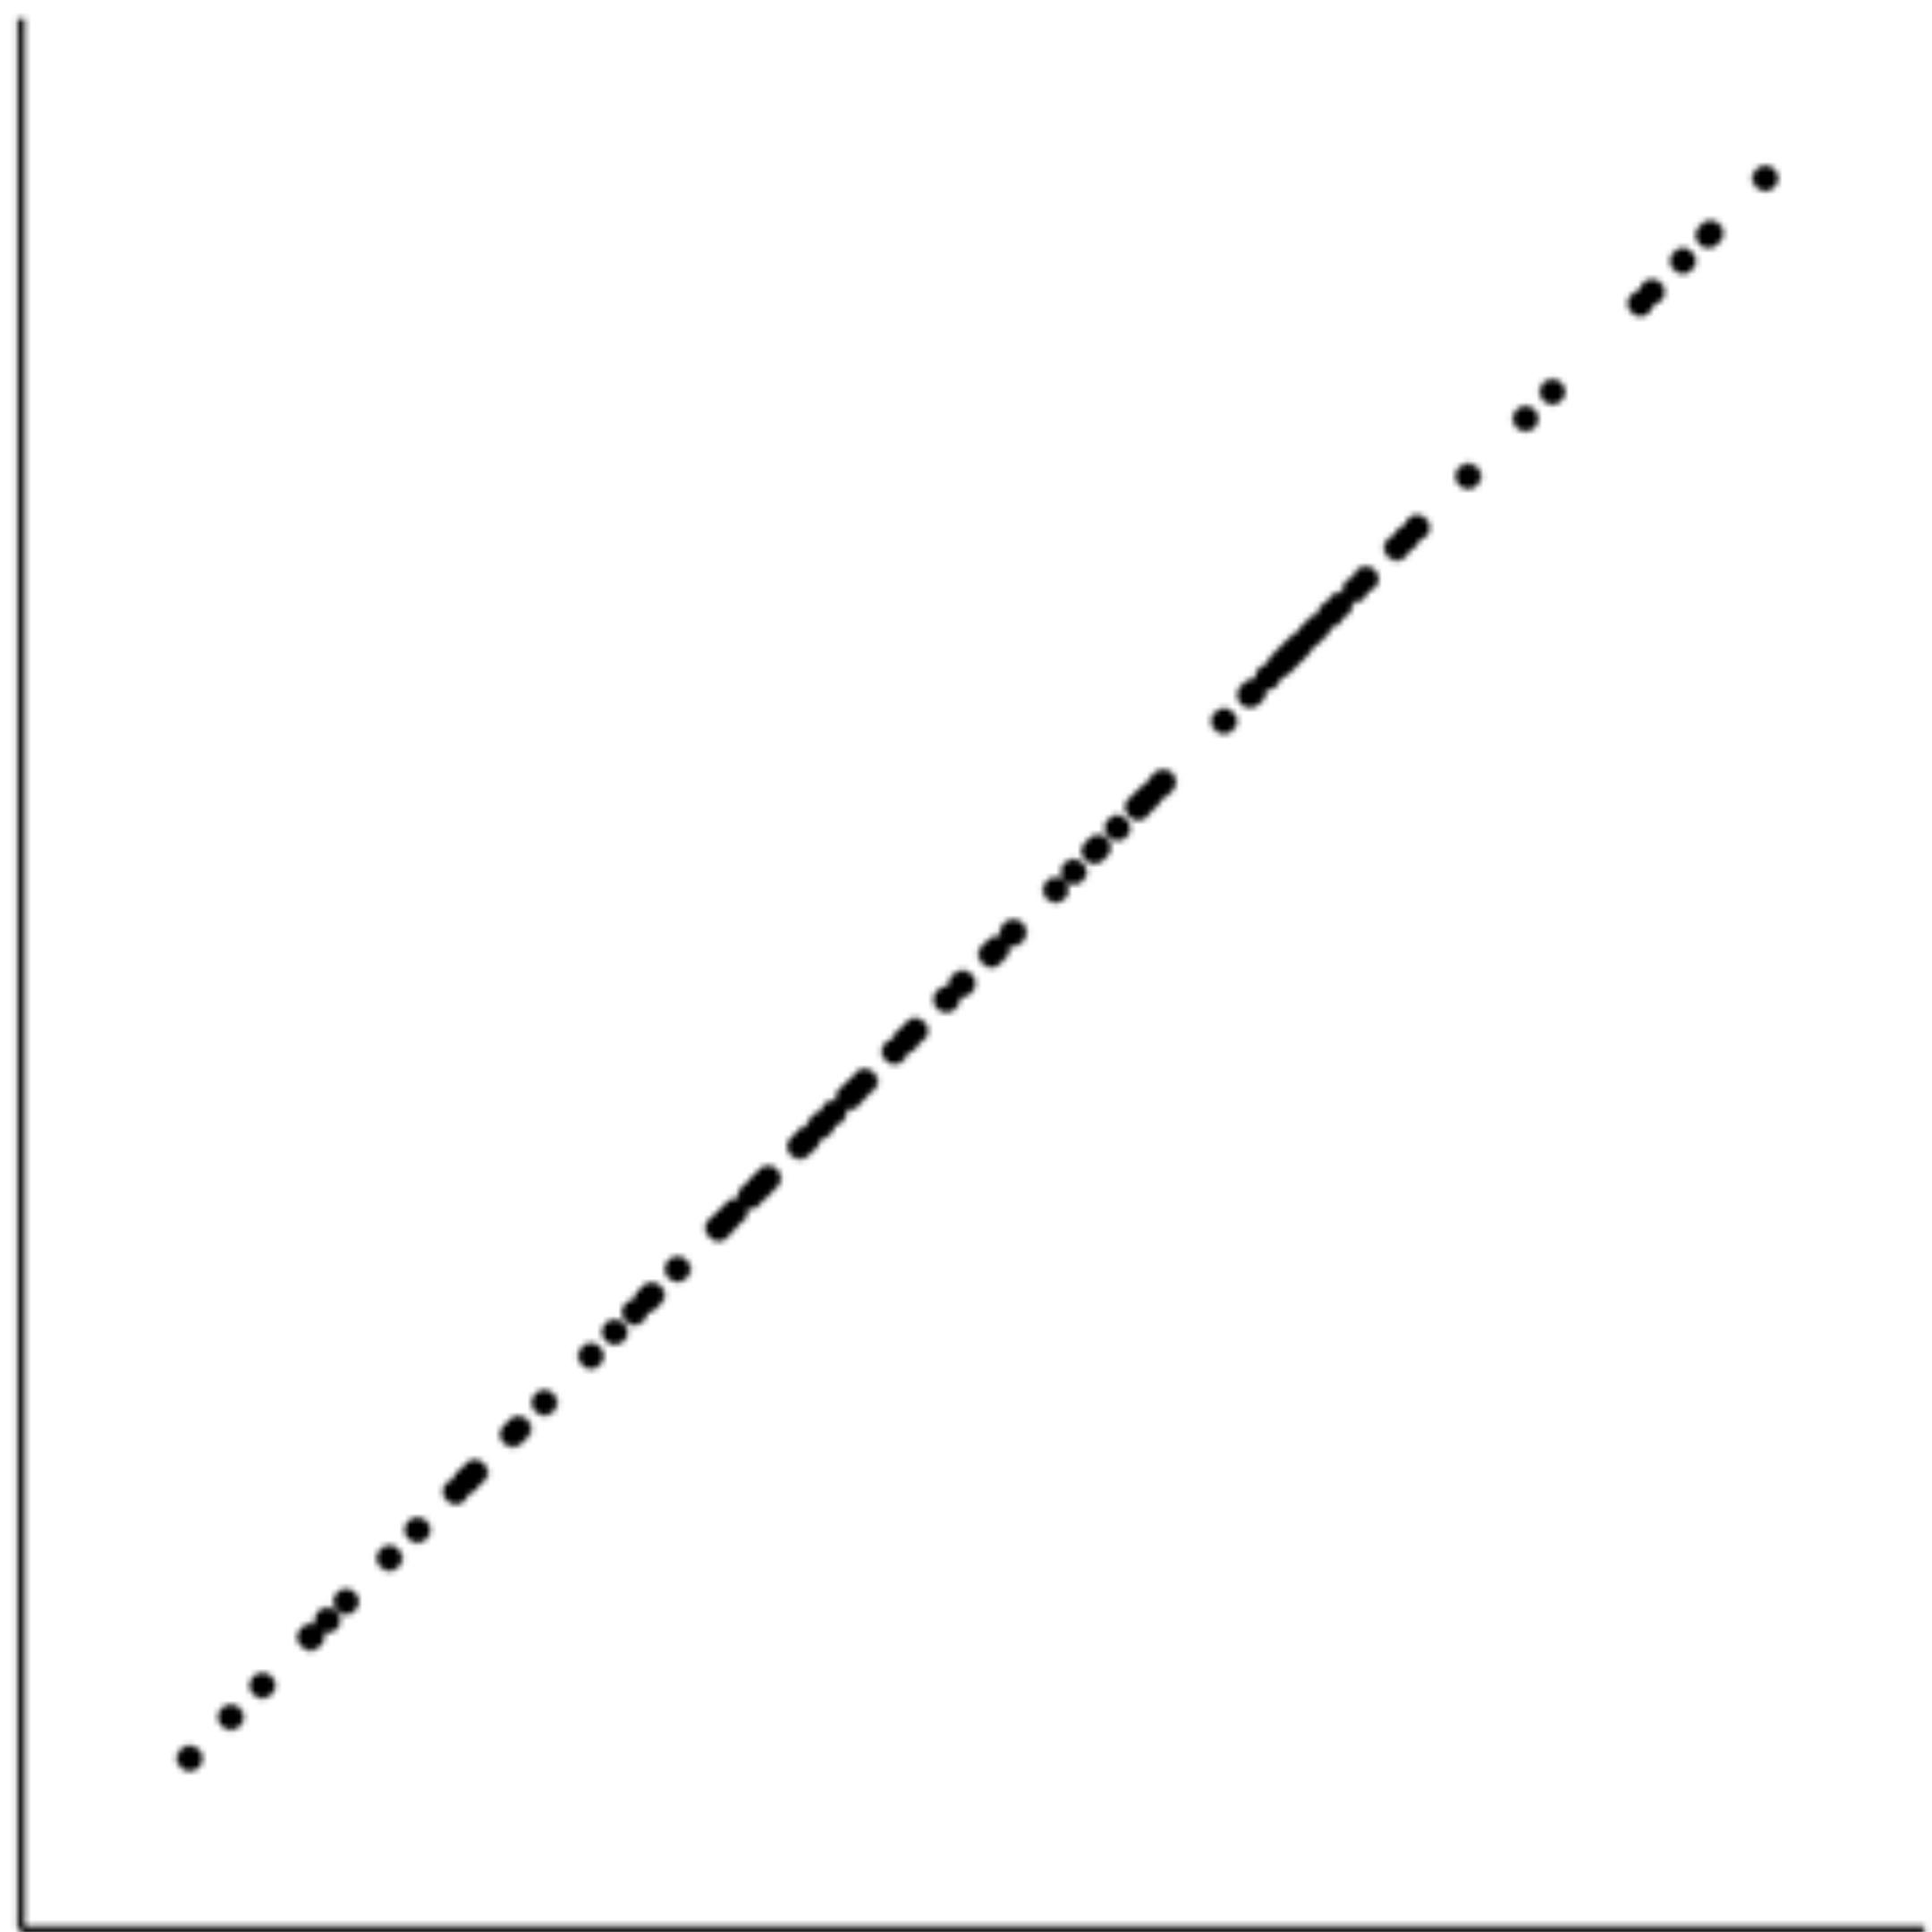

The Perception of Correlation in Scatterplots

- *Used psychophysiological methodologies.*
- *Inferred just-noticeable differences for scatterplots depicting positive correlations.*
- *Established that the perception of correlation in scatterplots can be modeled using Weber's law.*

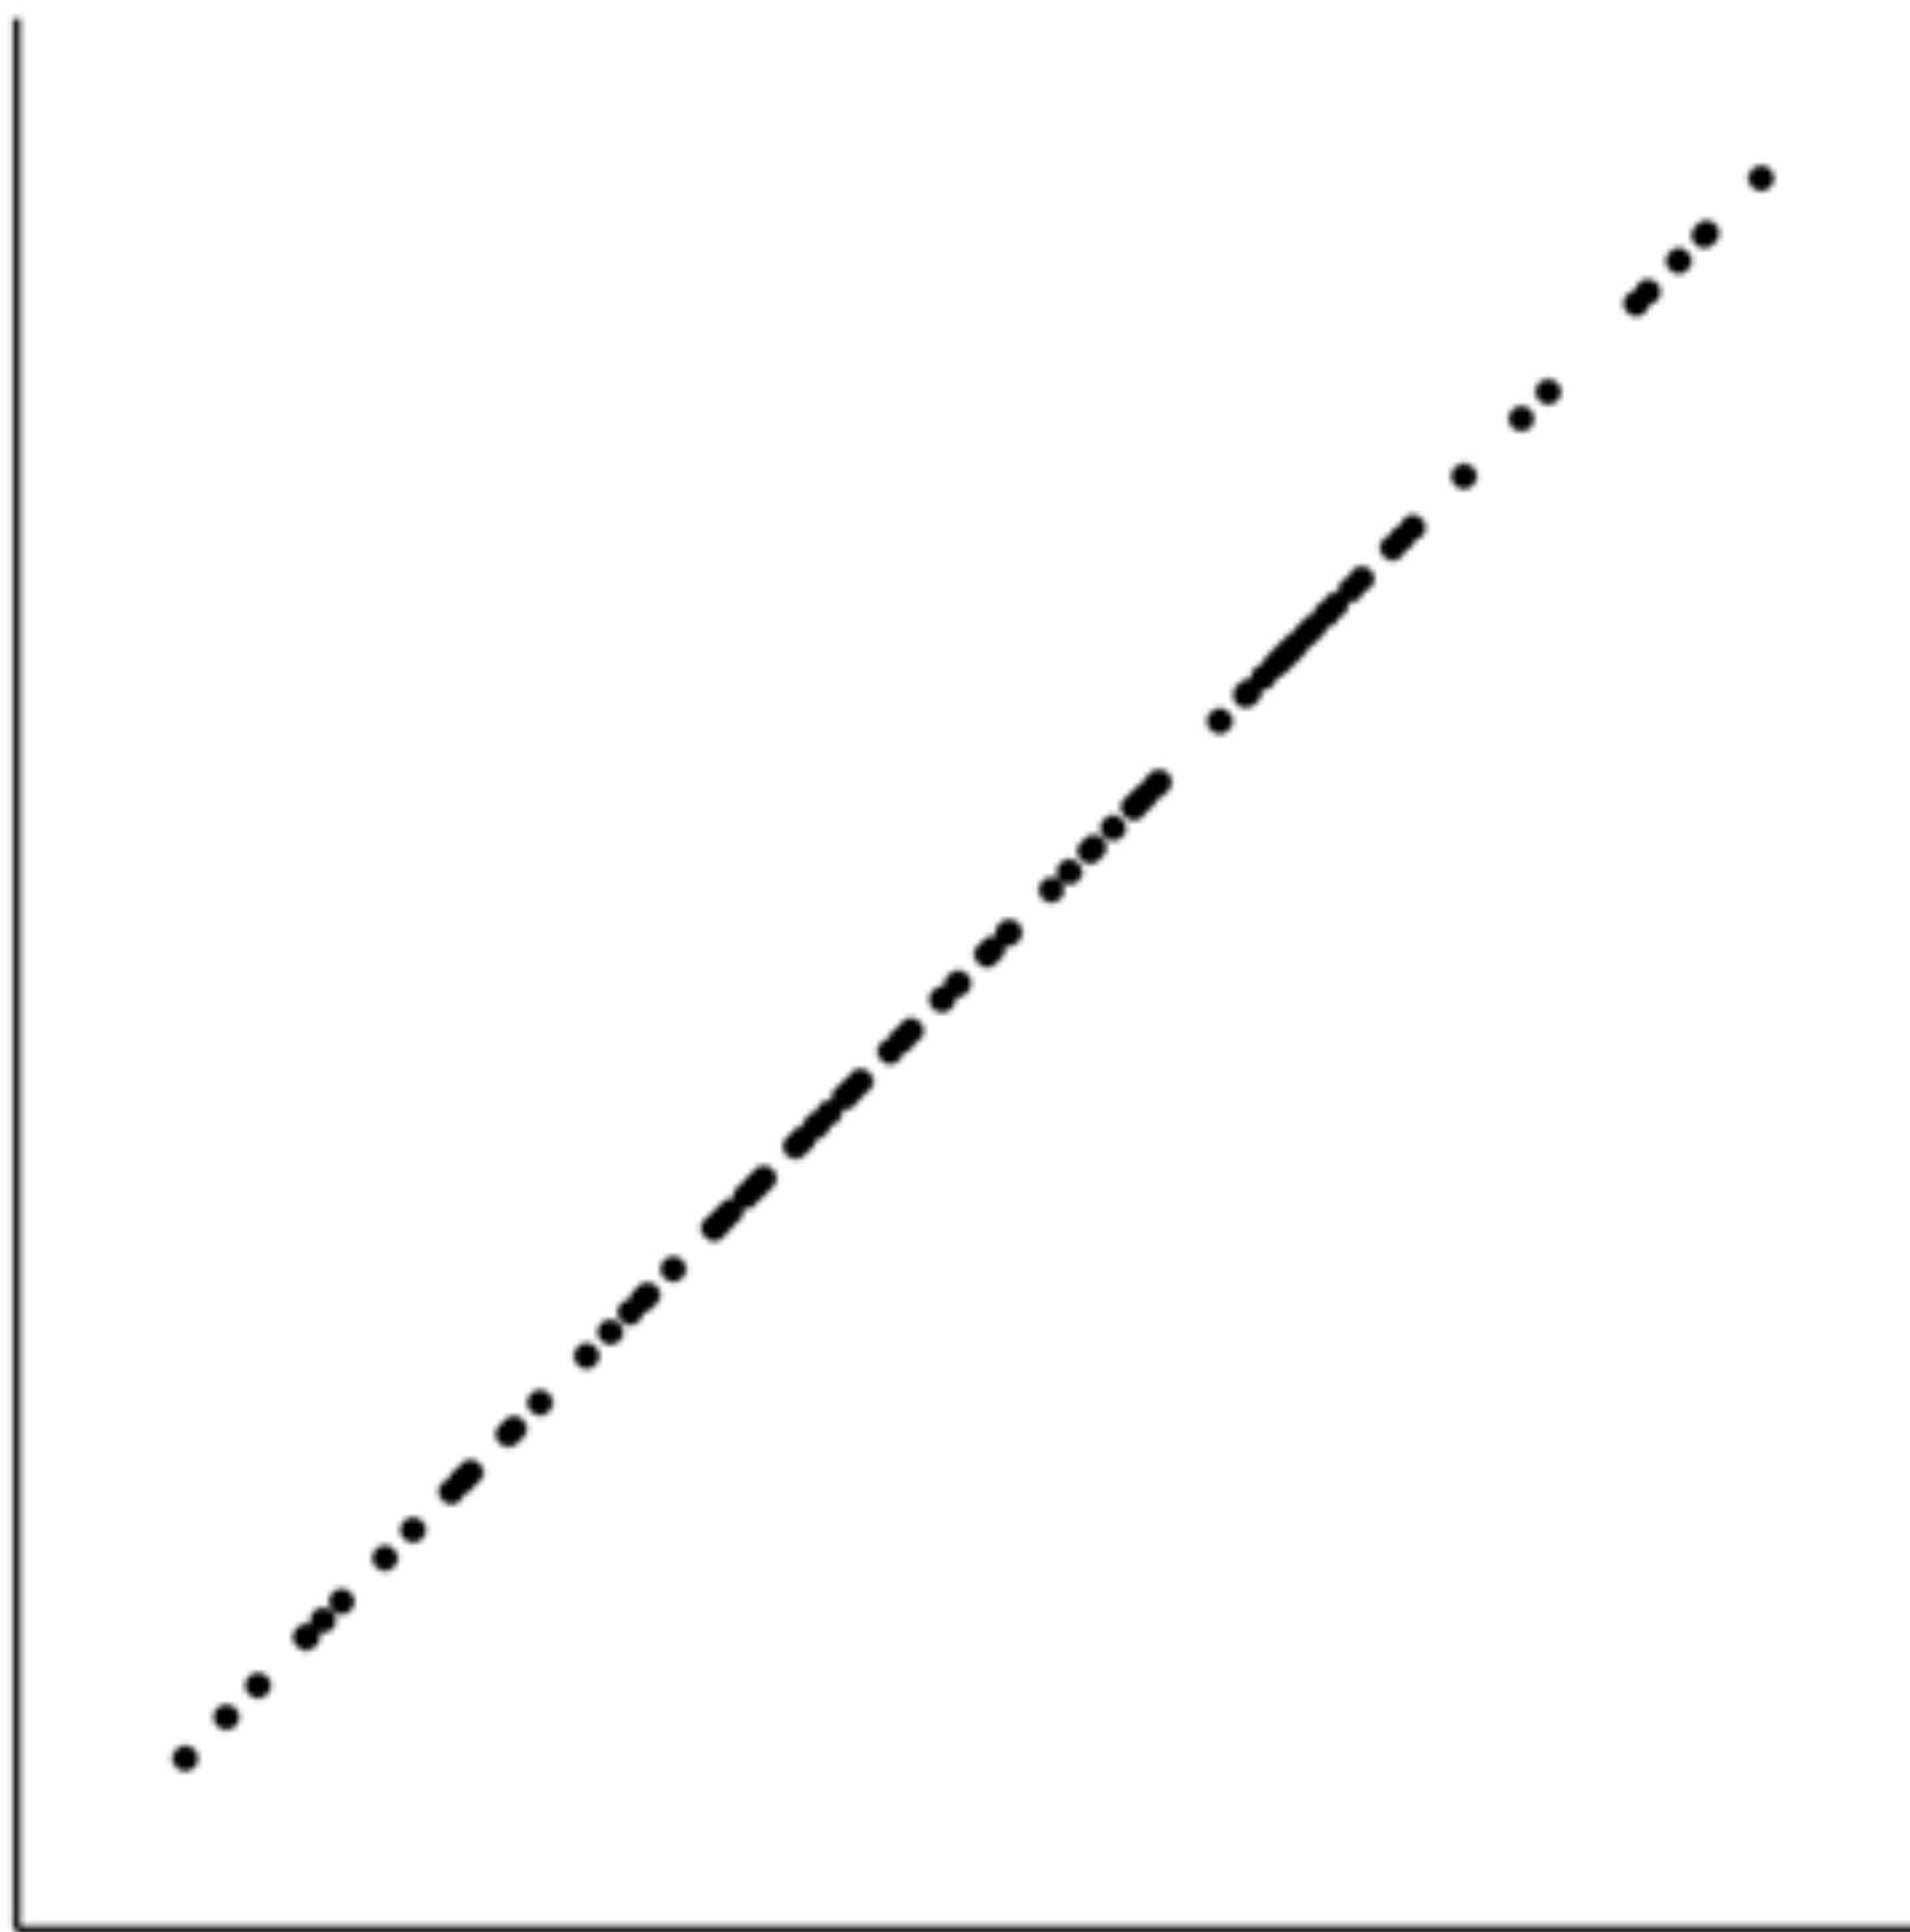

*Psychophysiological
methodology:*

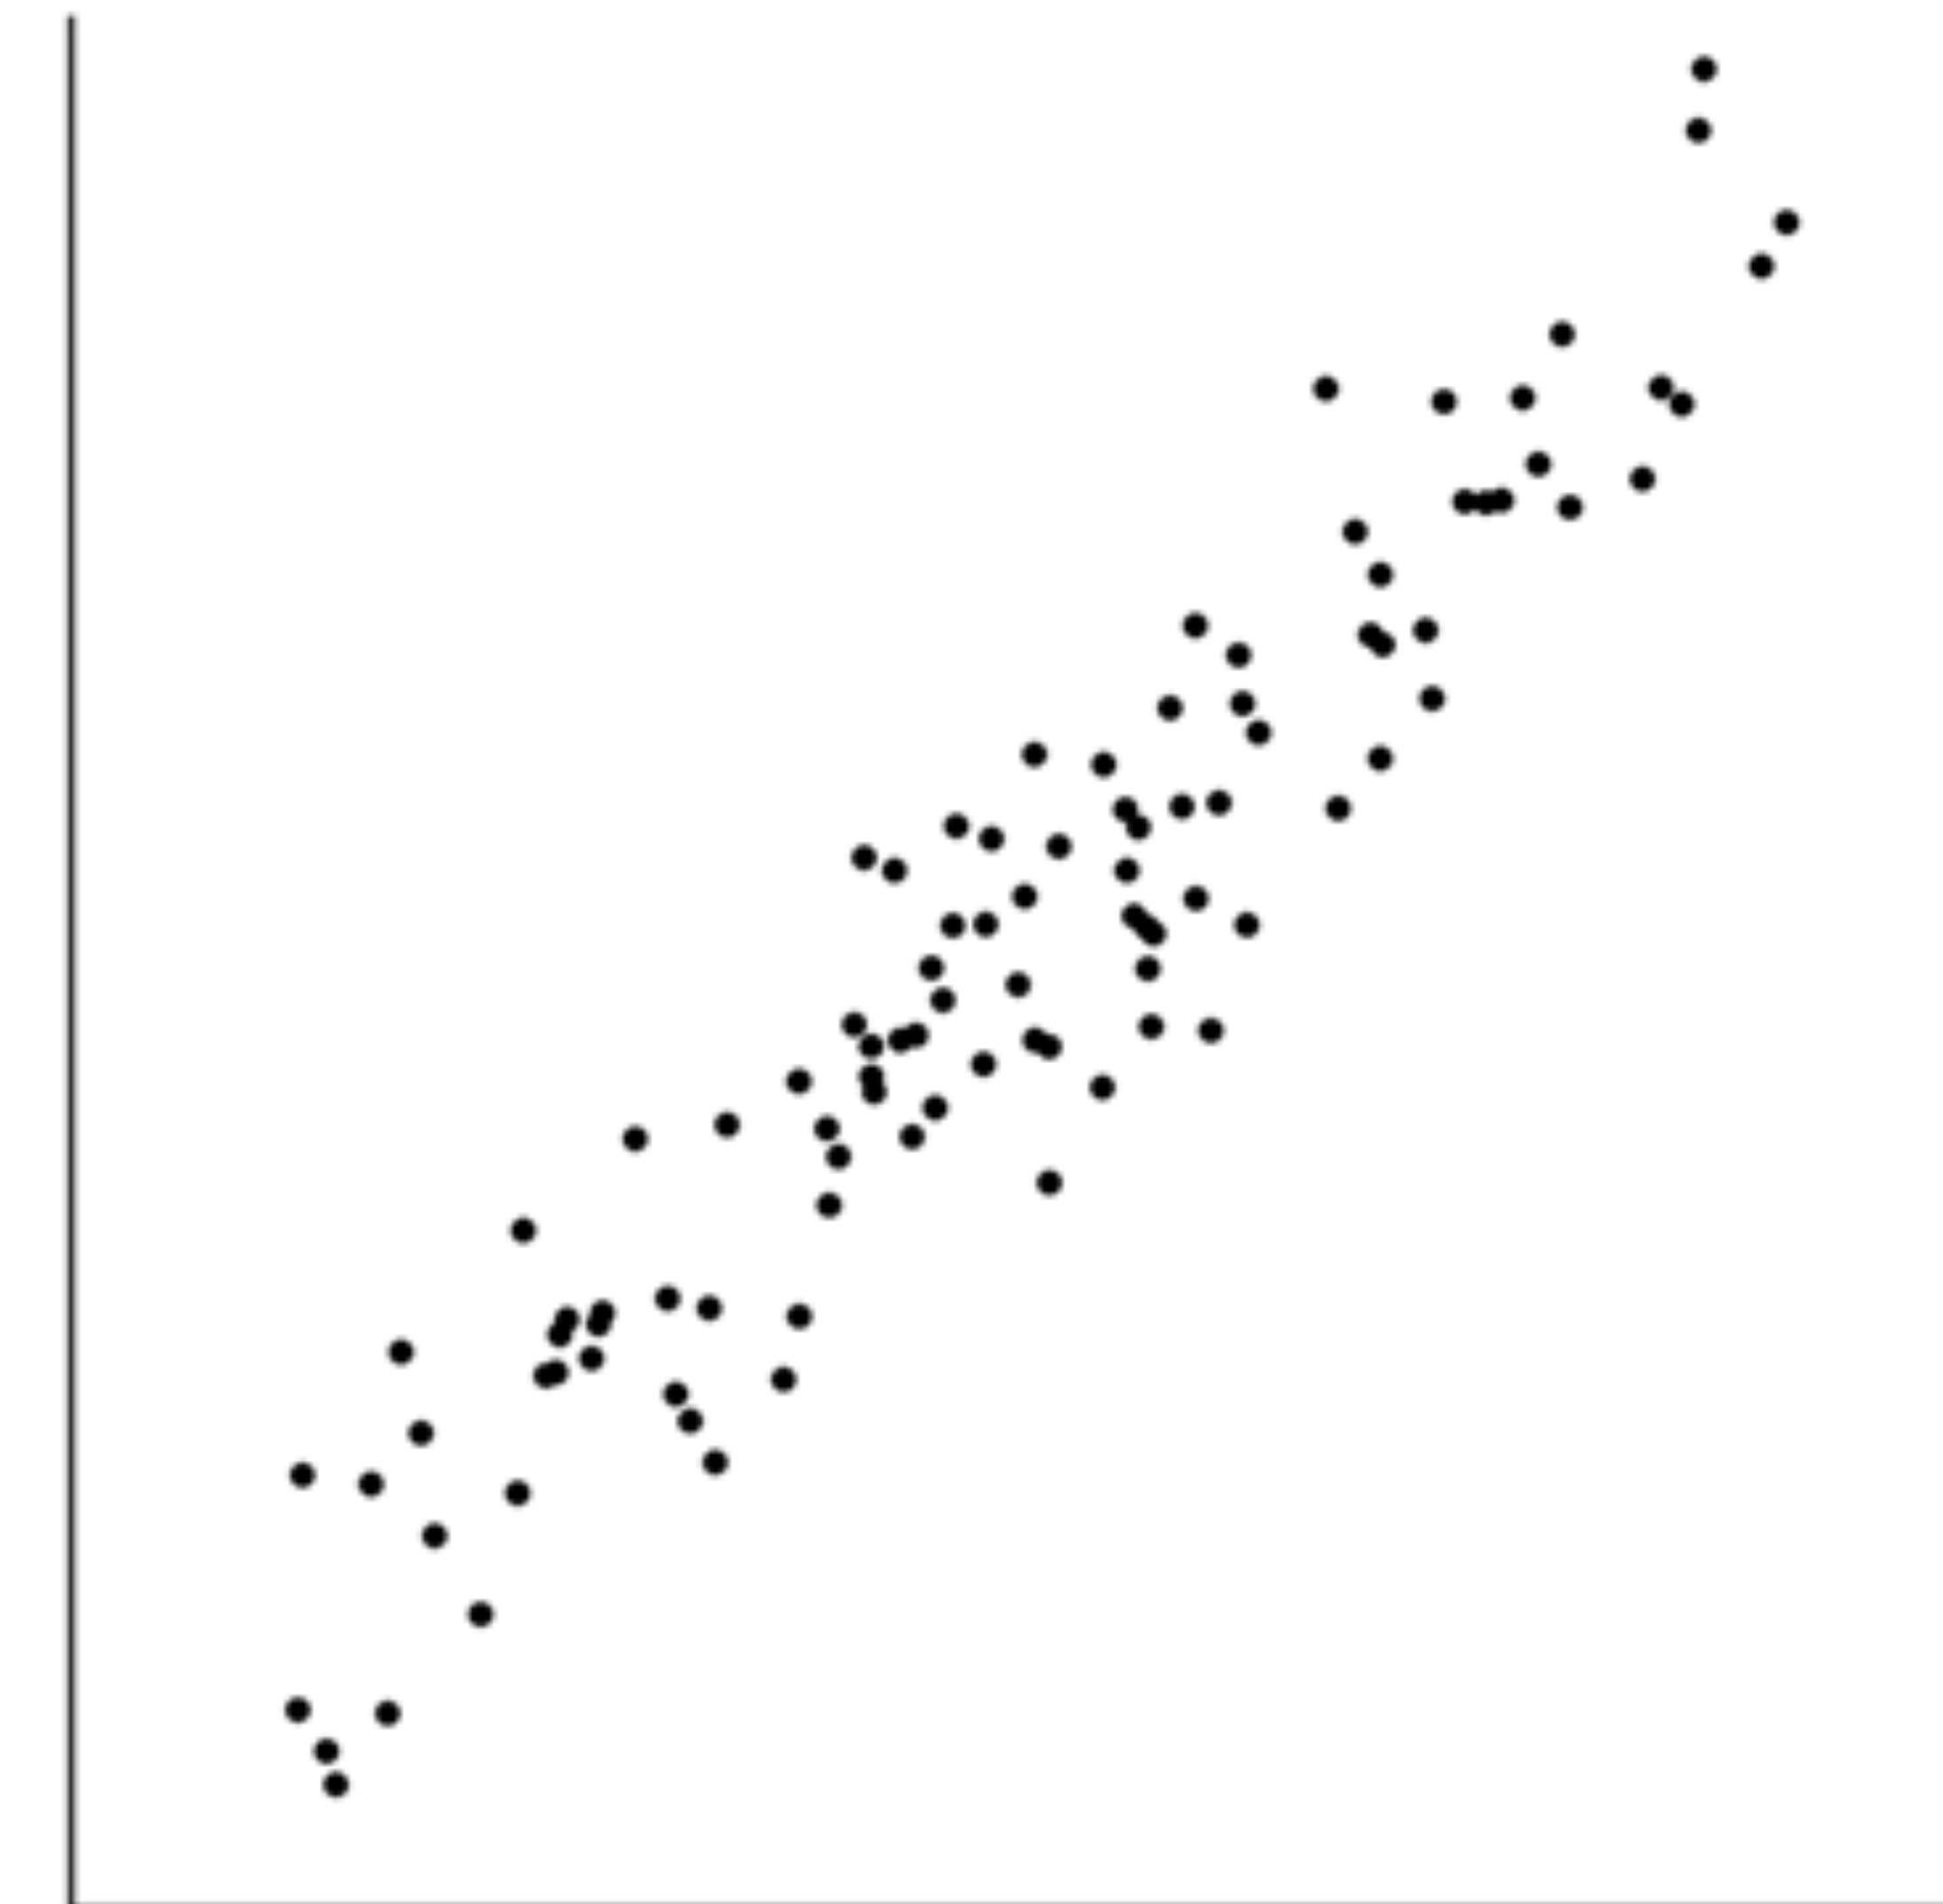

Which is more correlated?

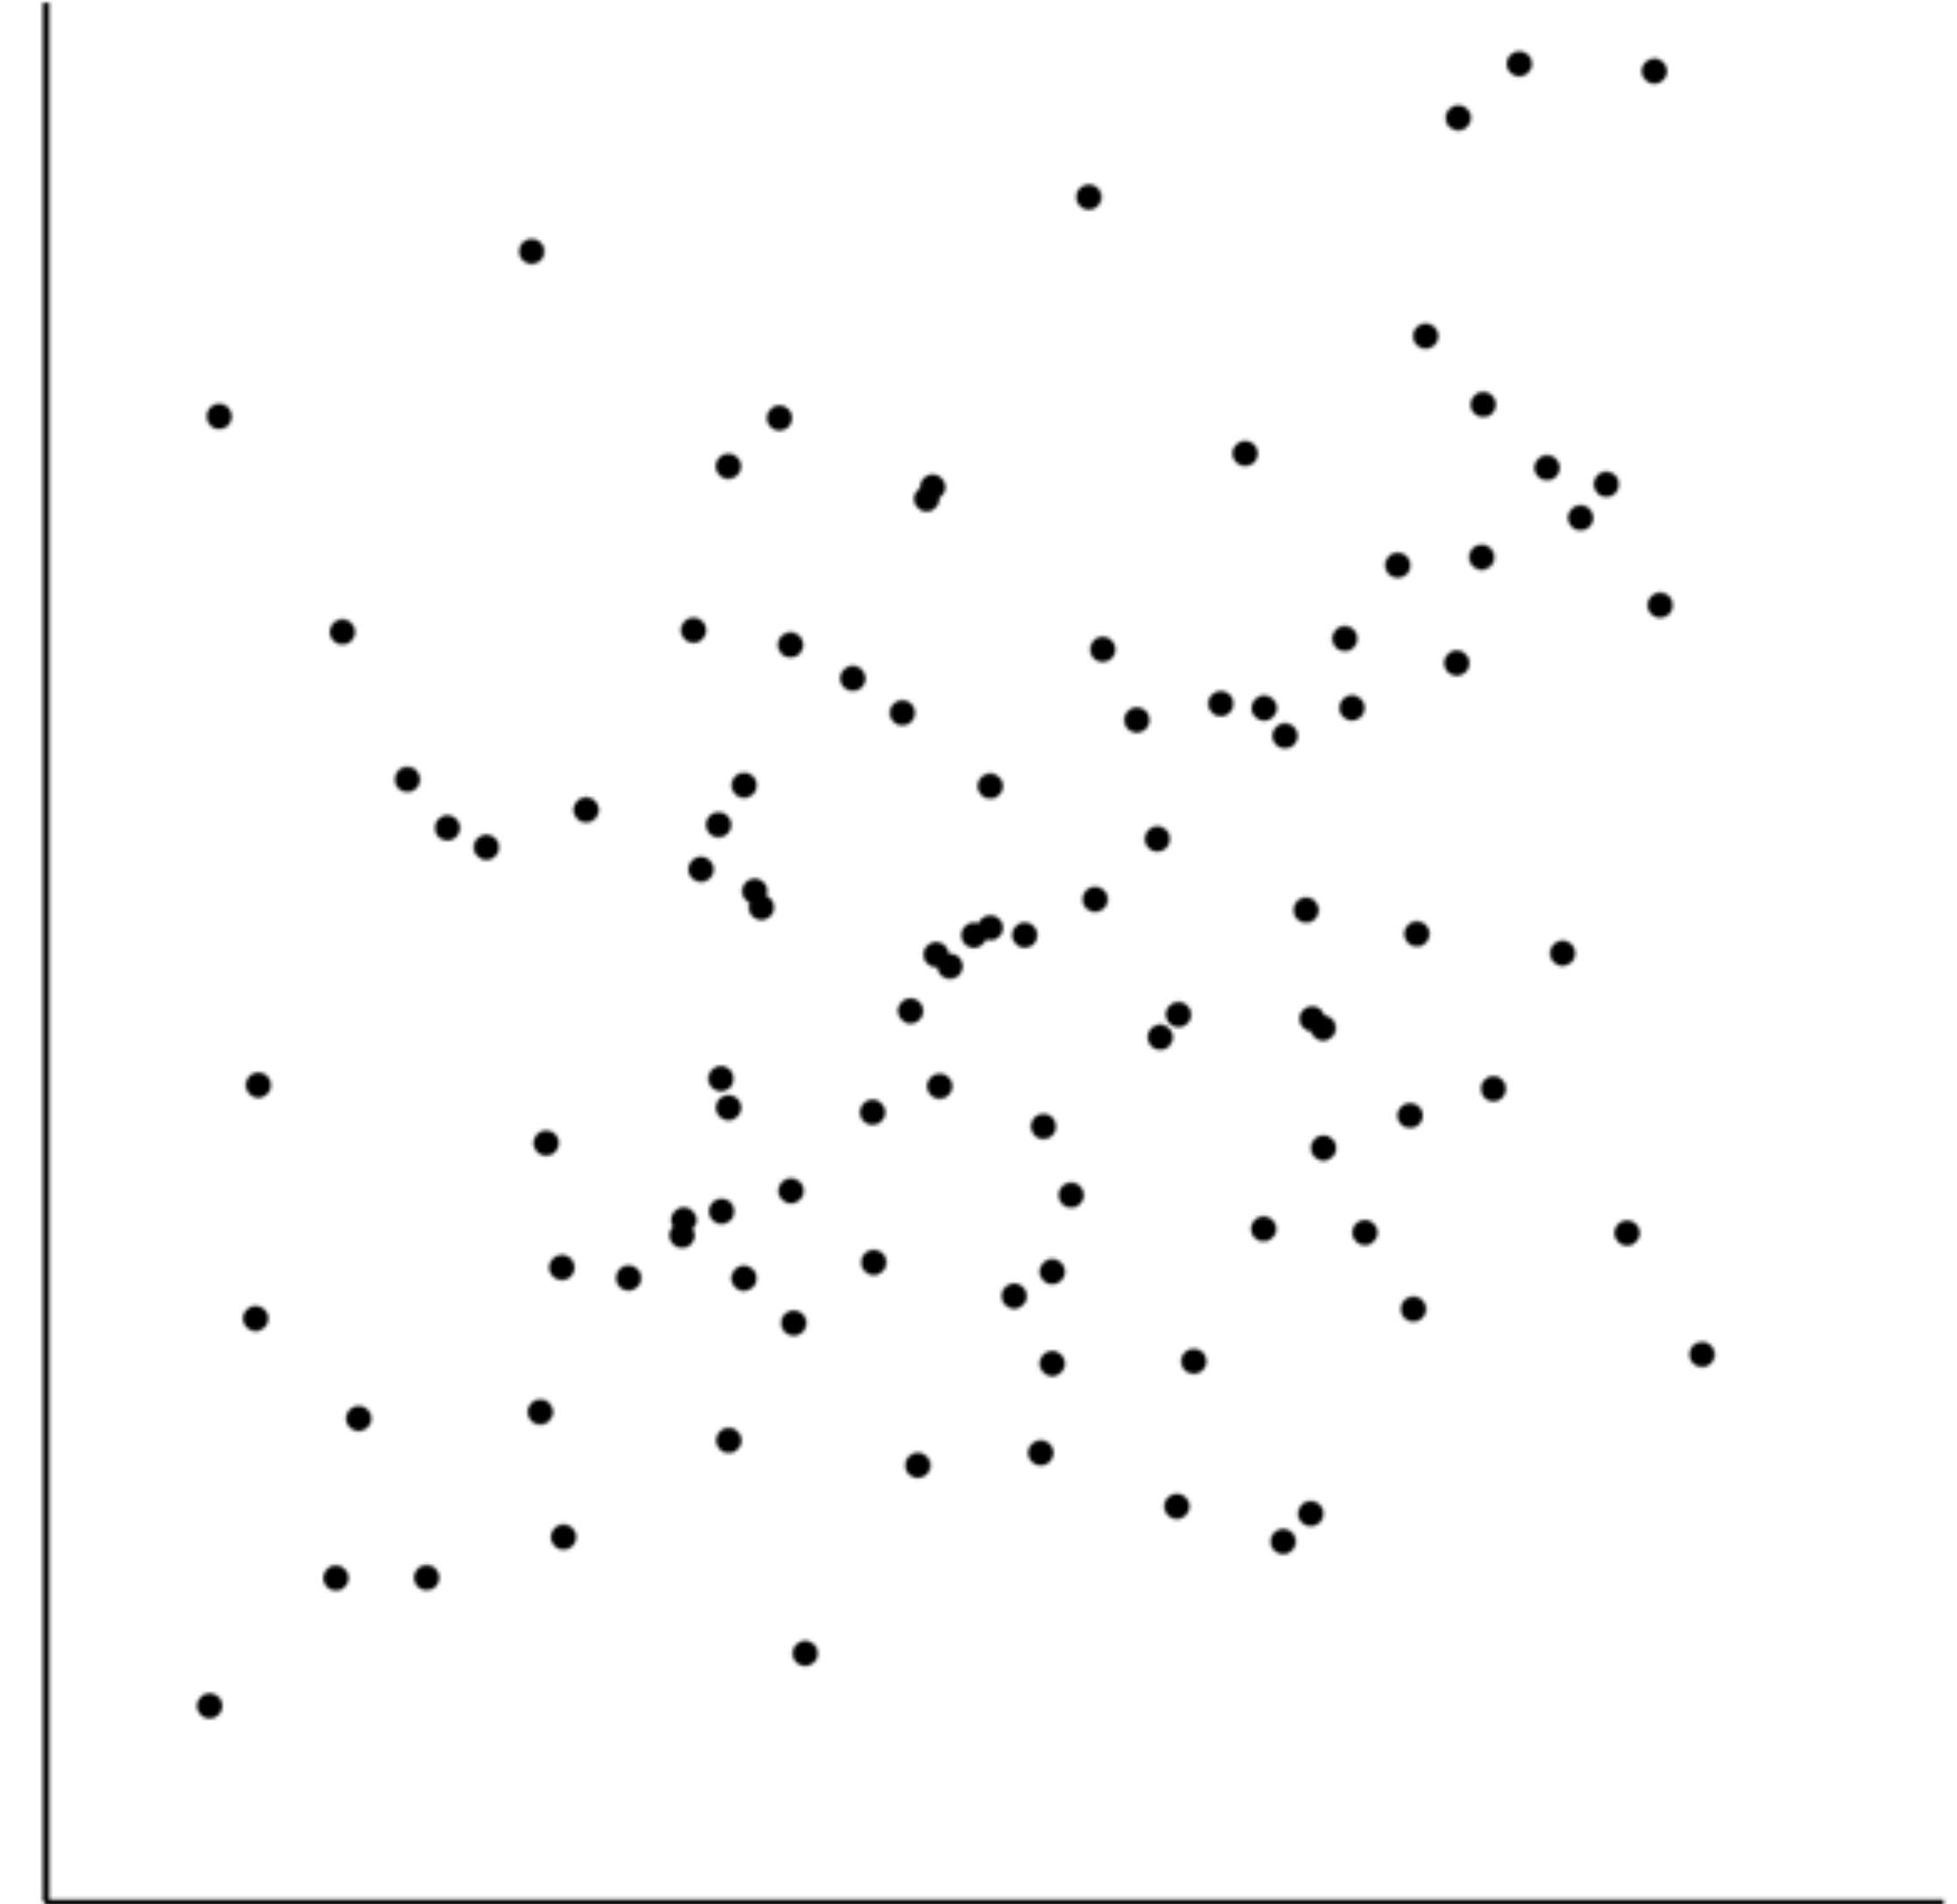

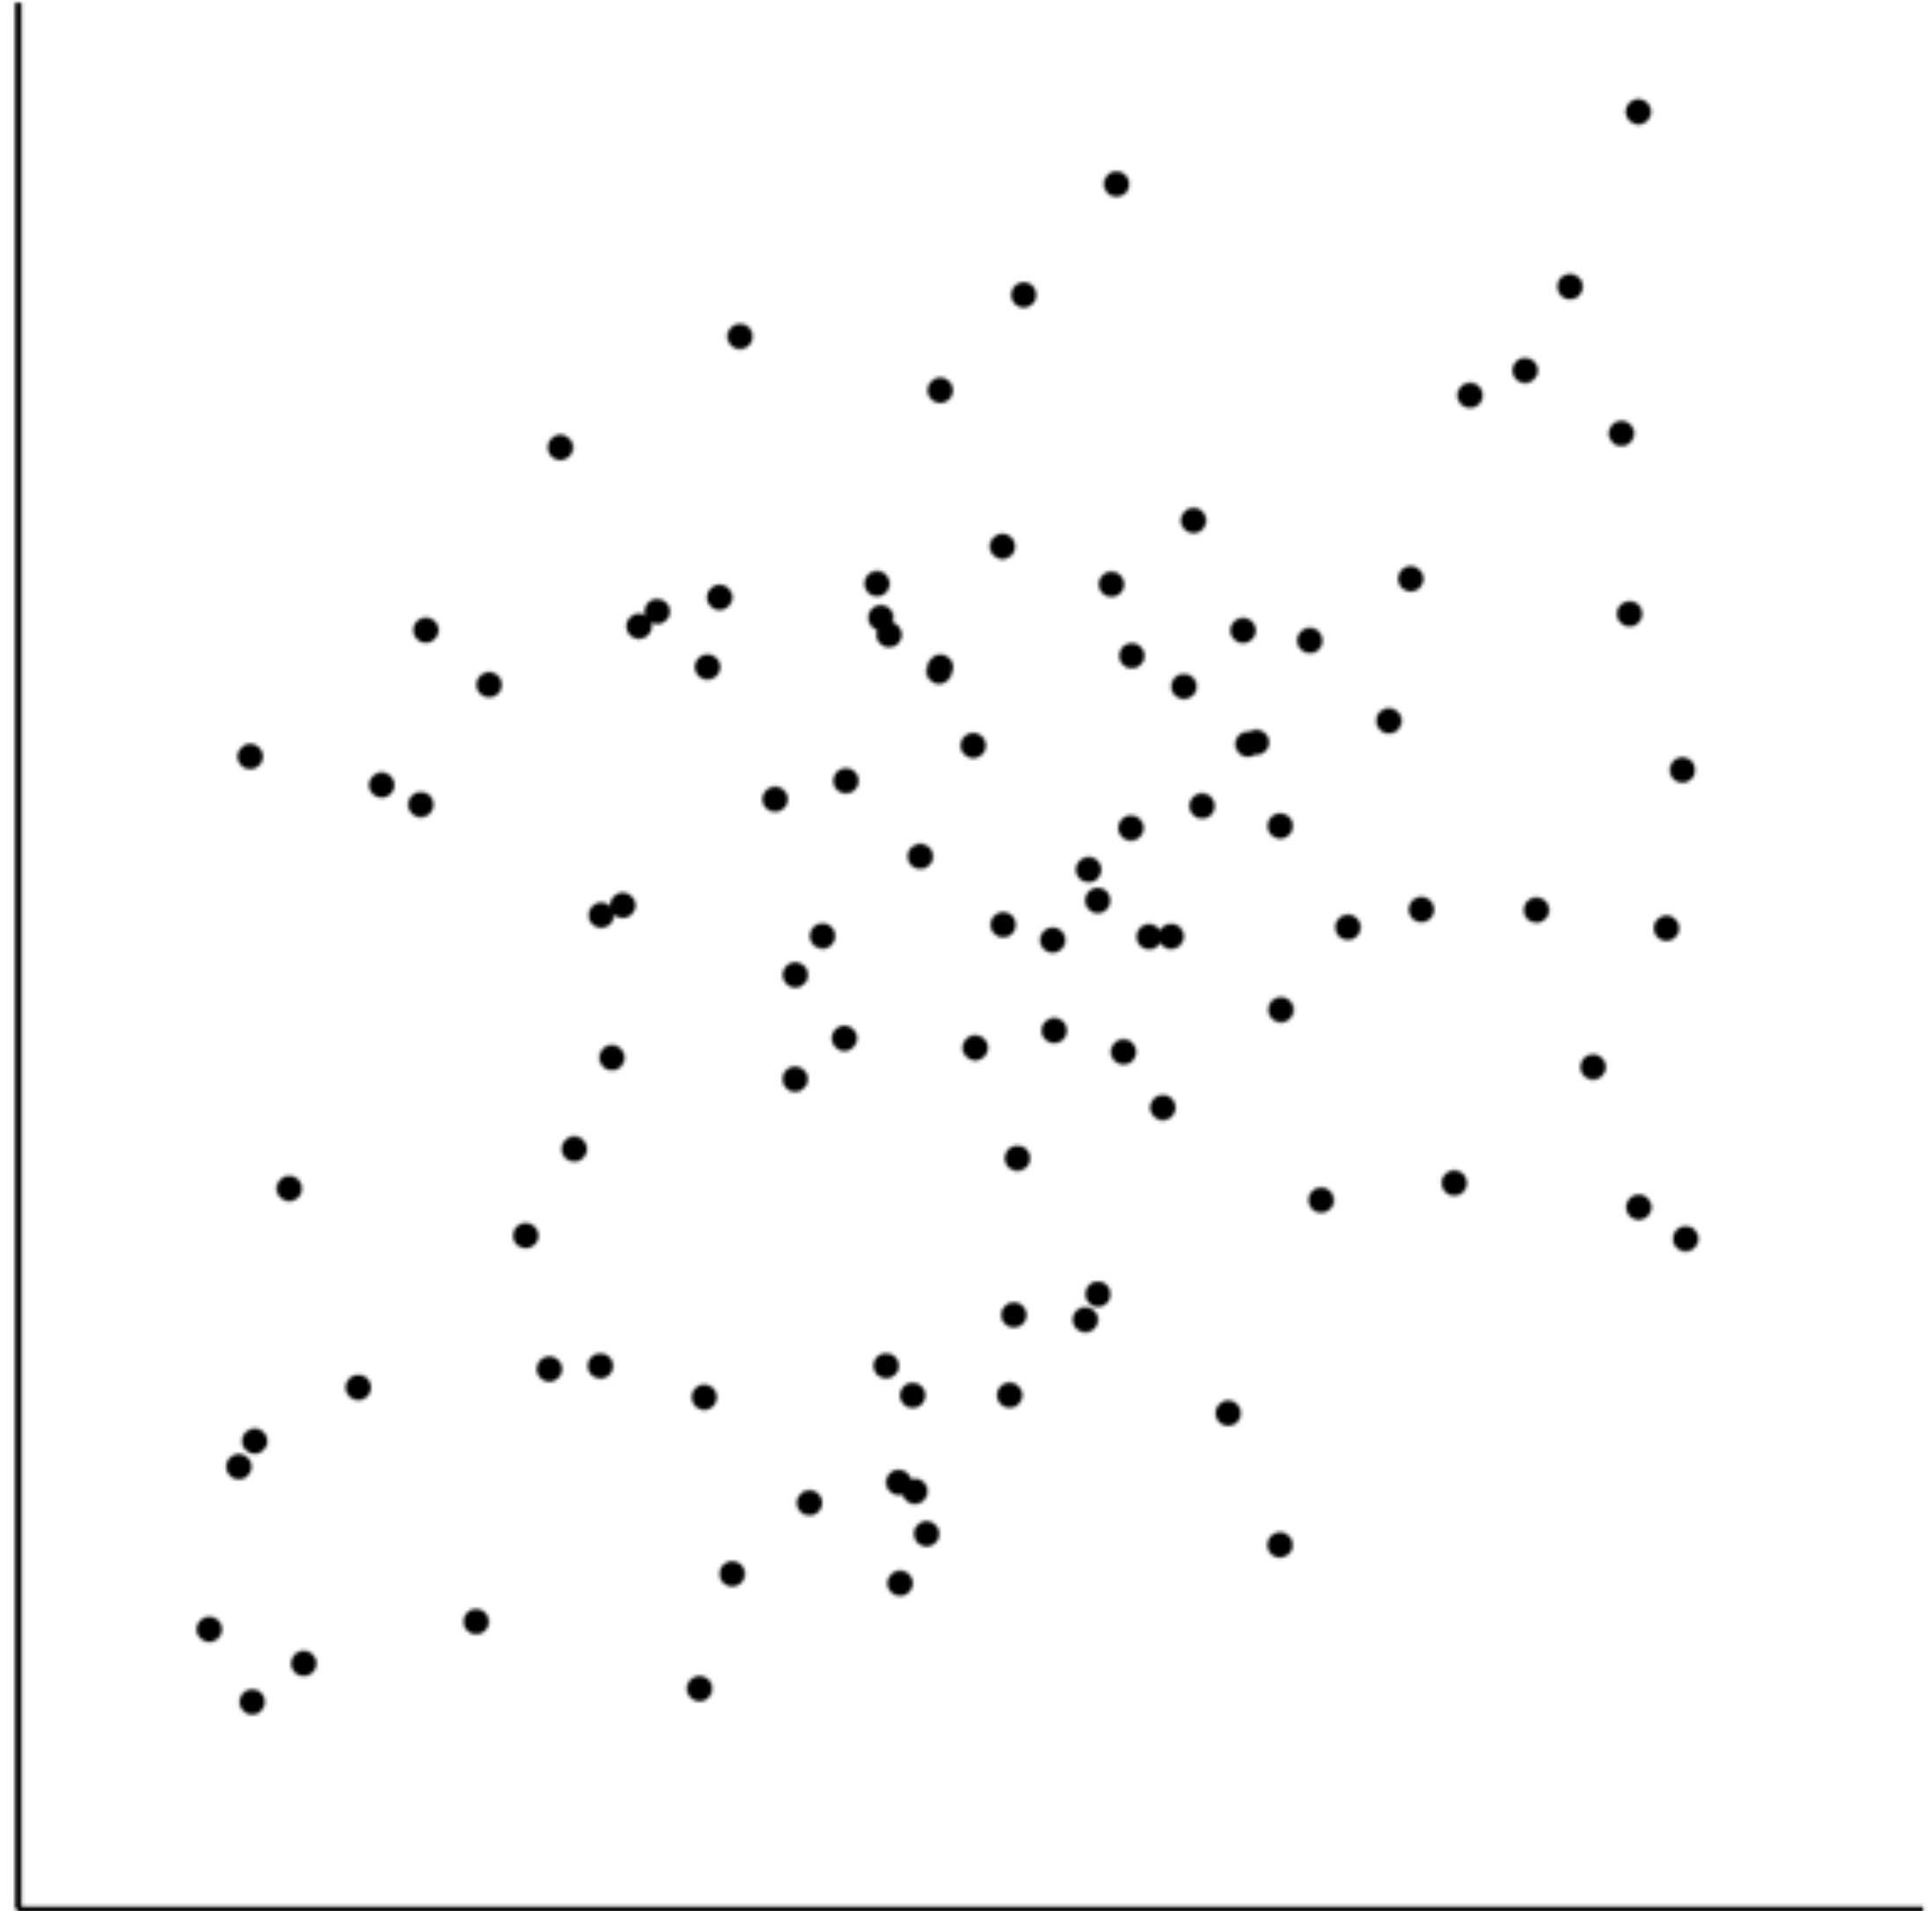

$r = 1$

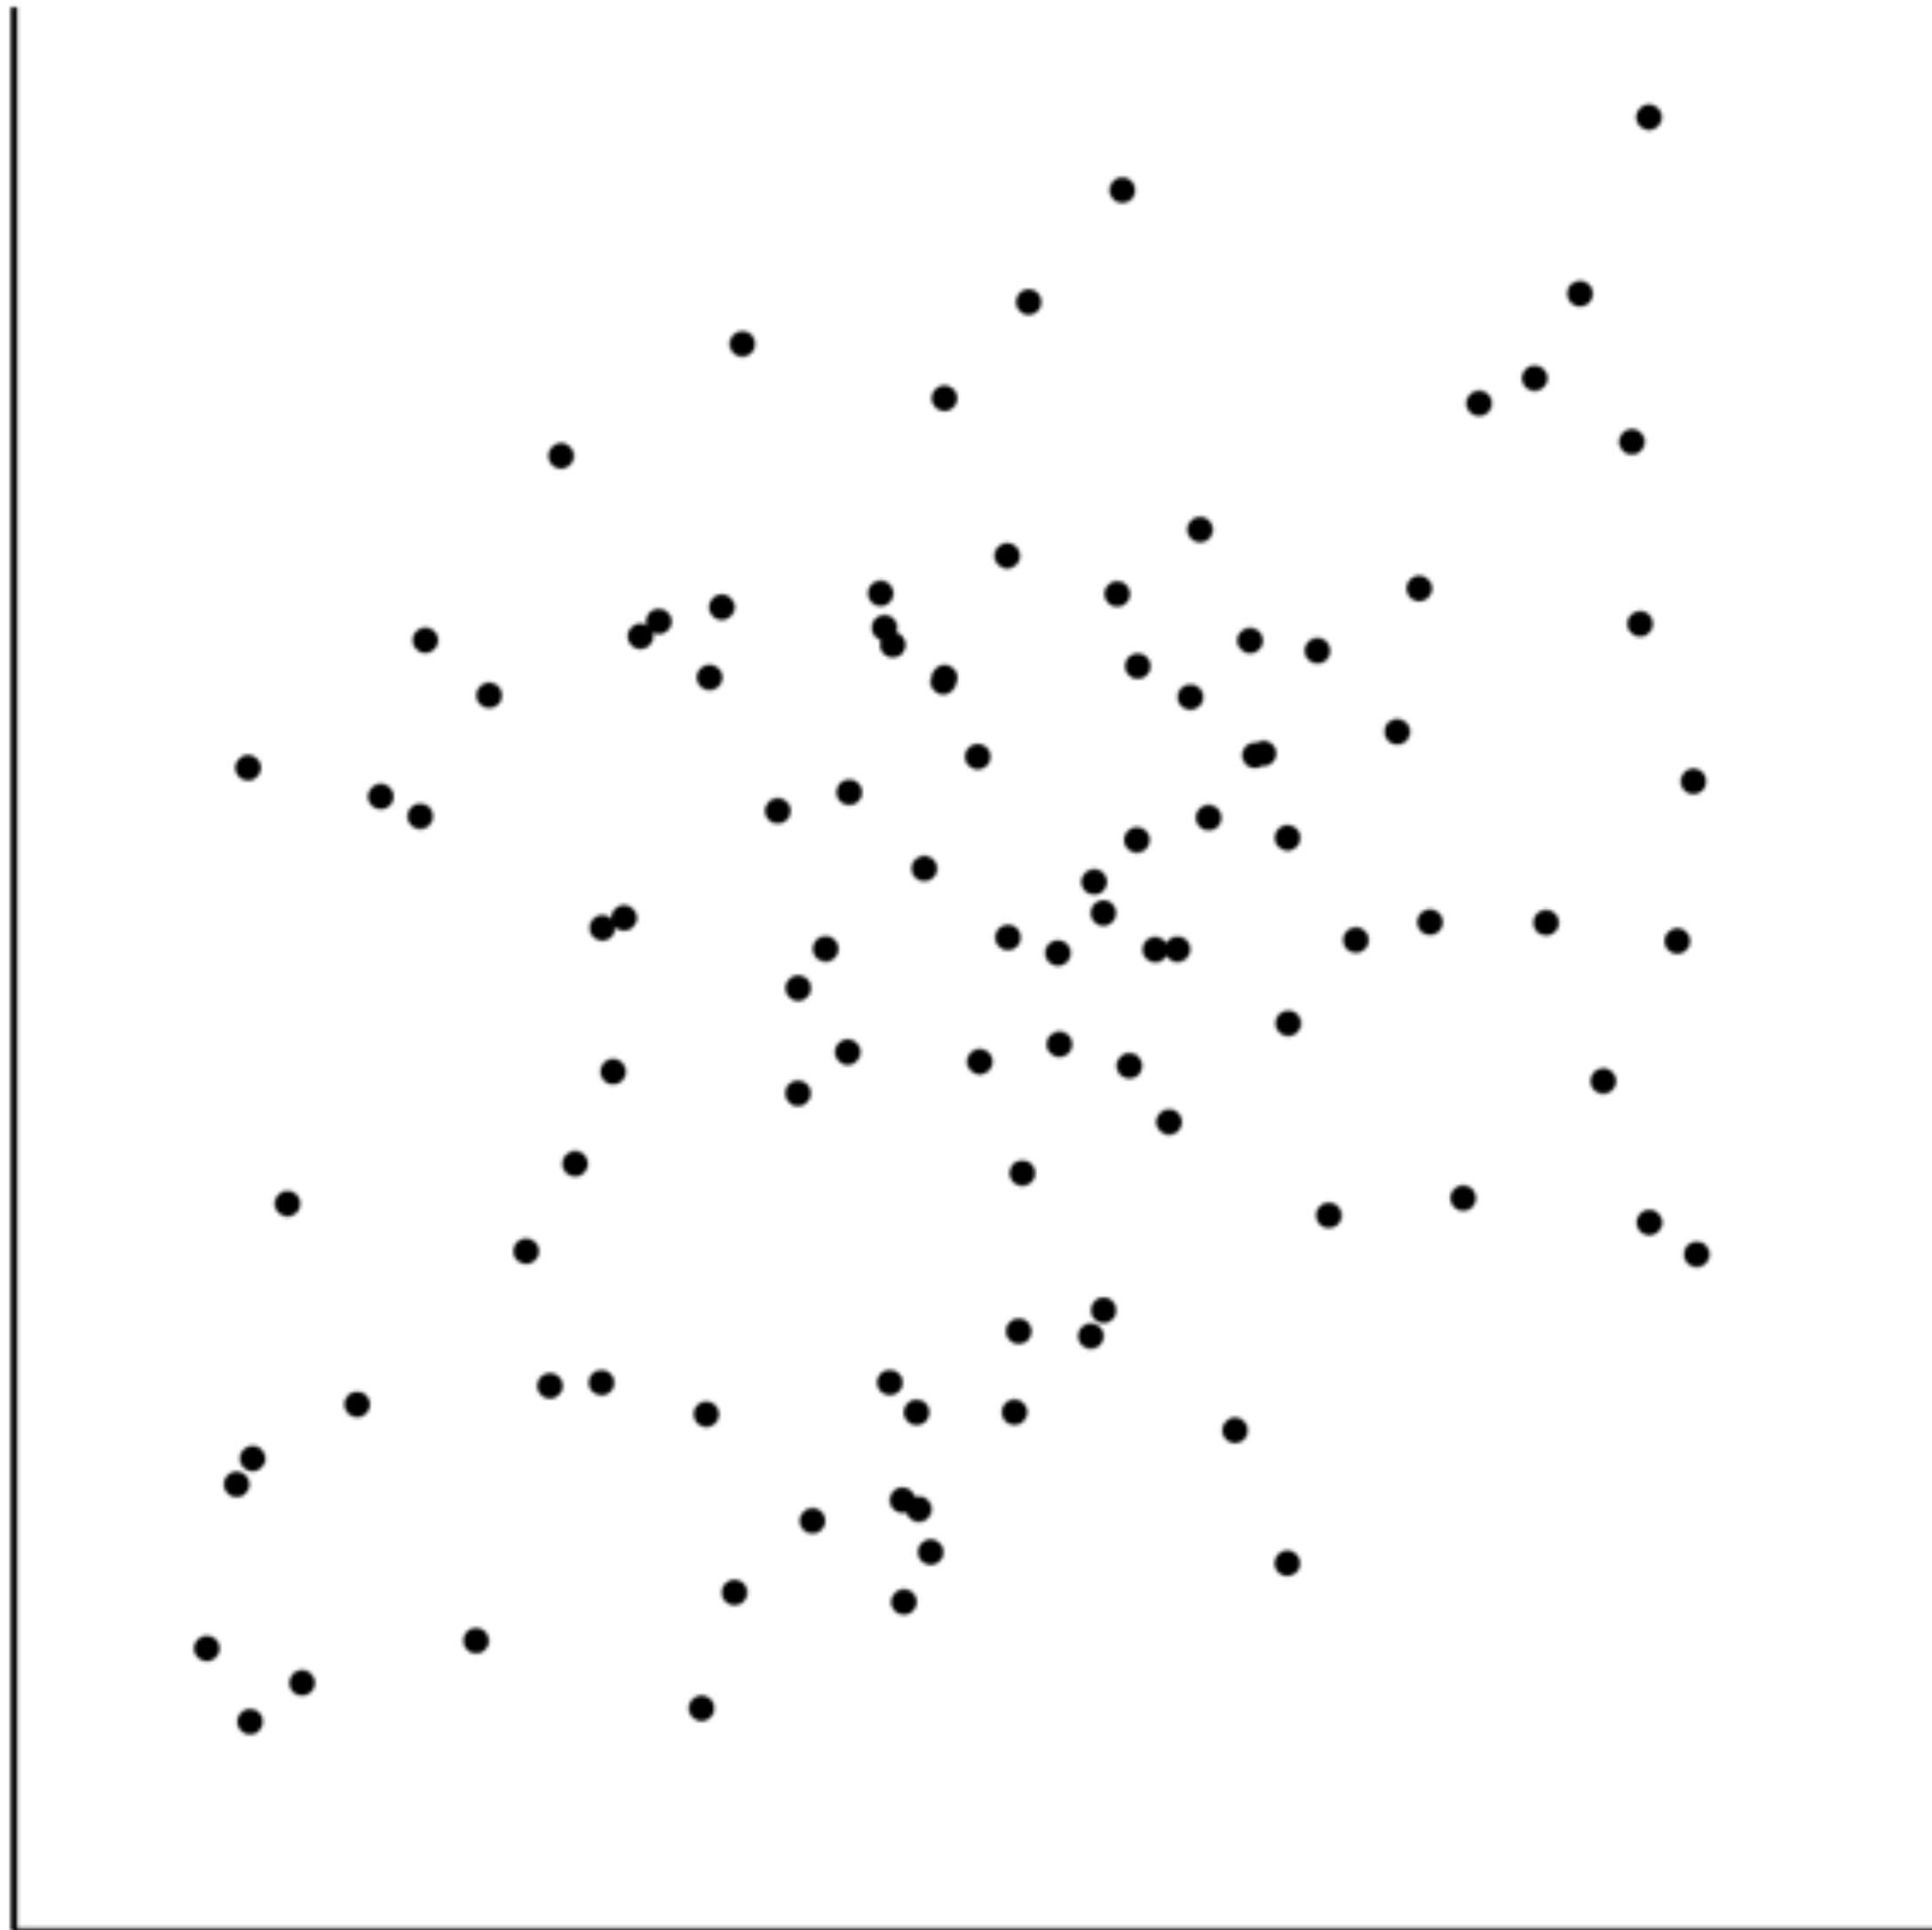

$r = 0.95$

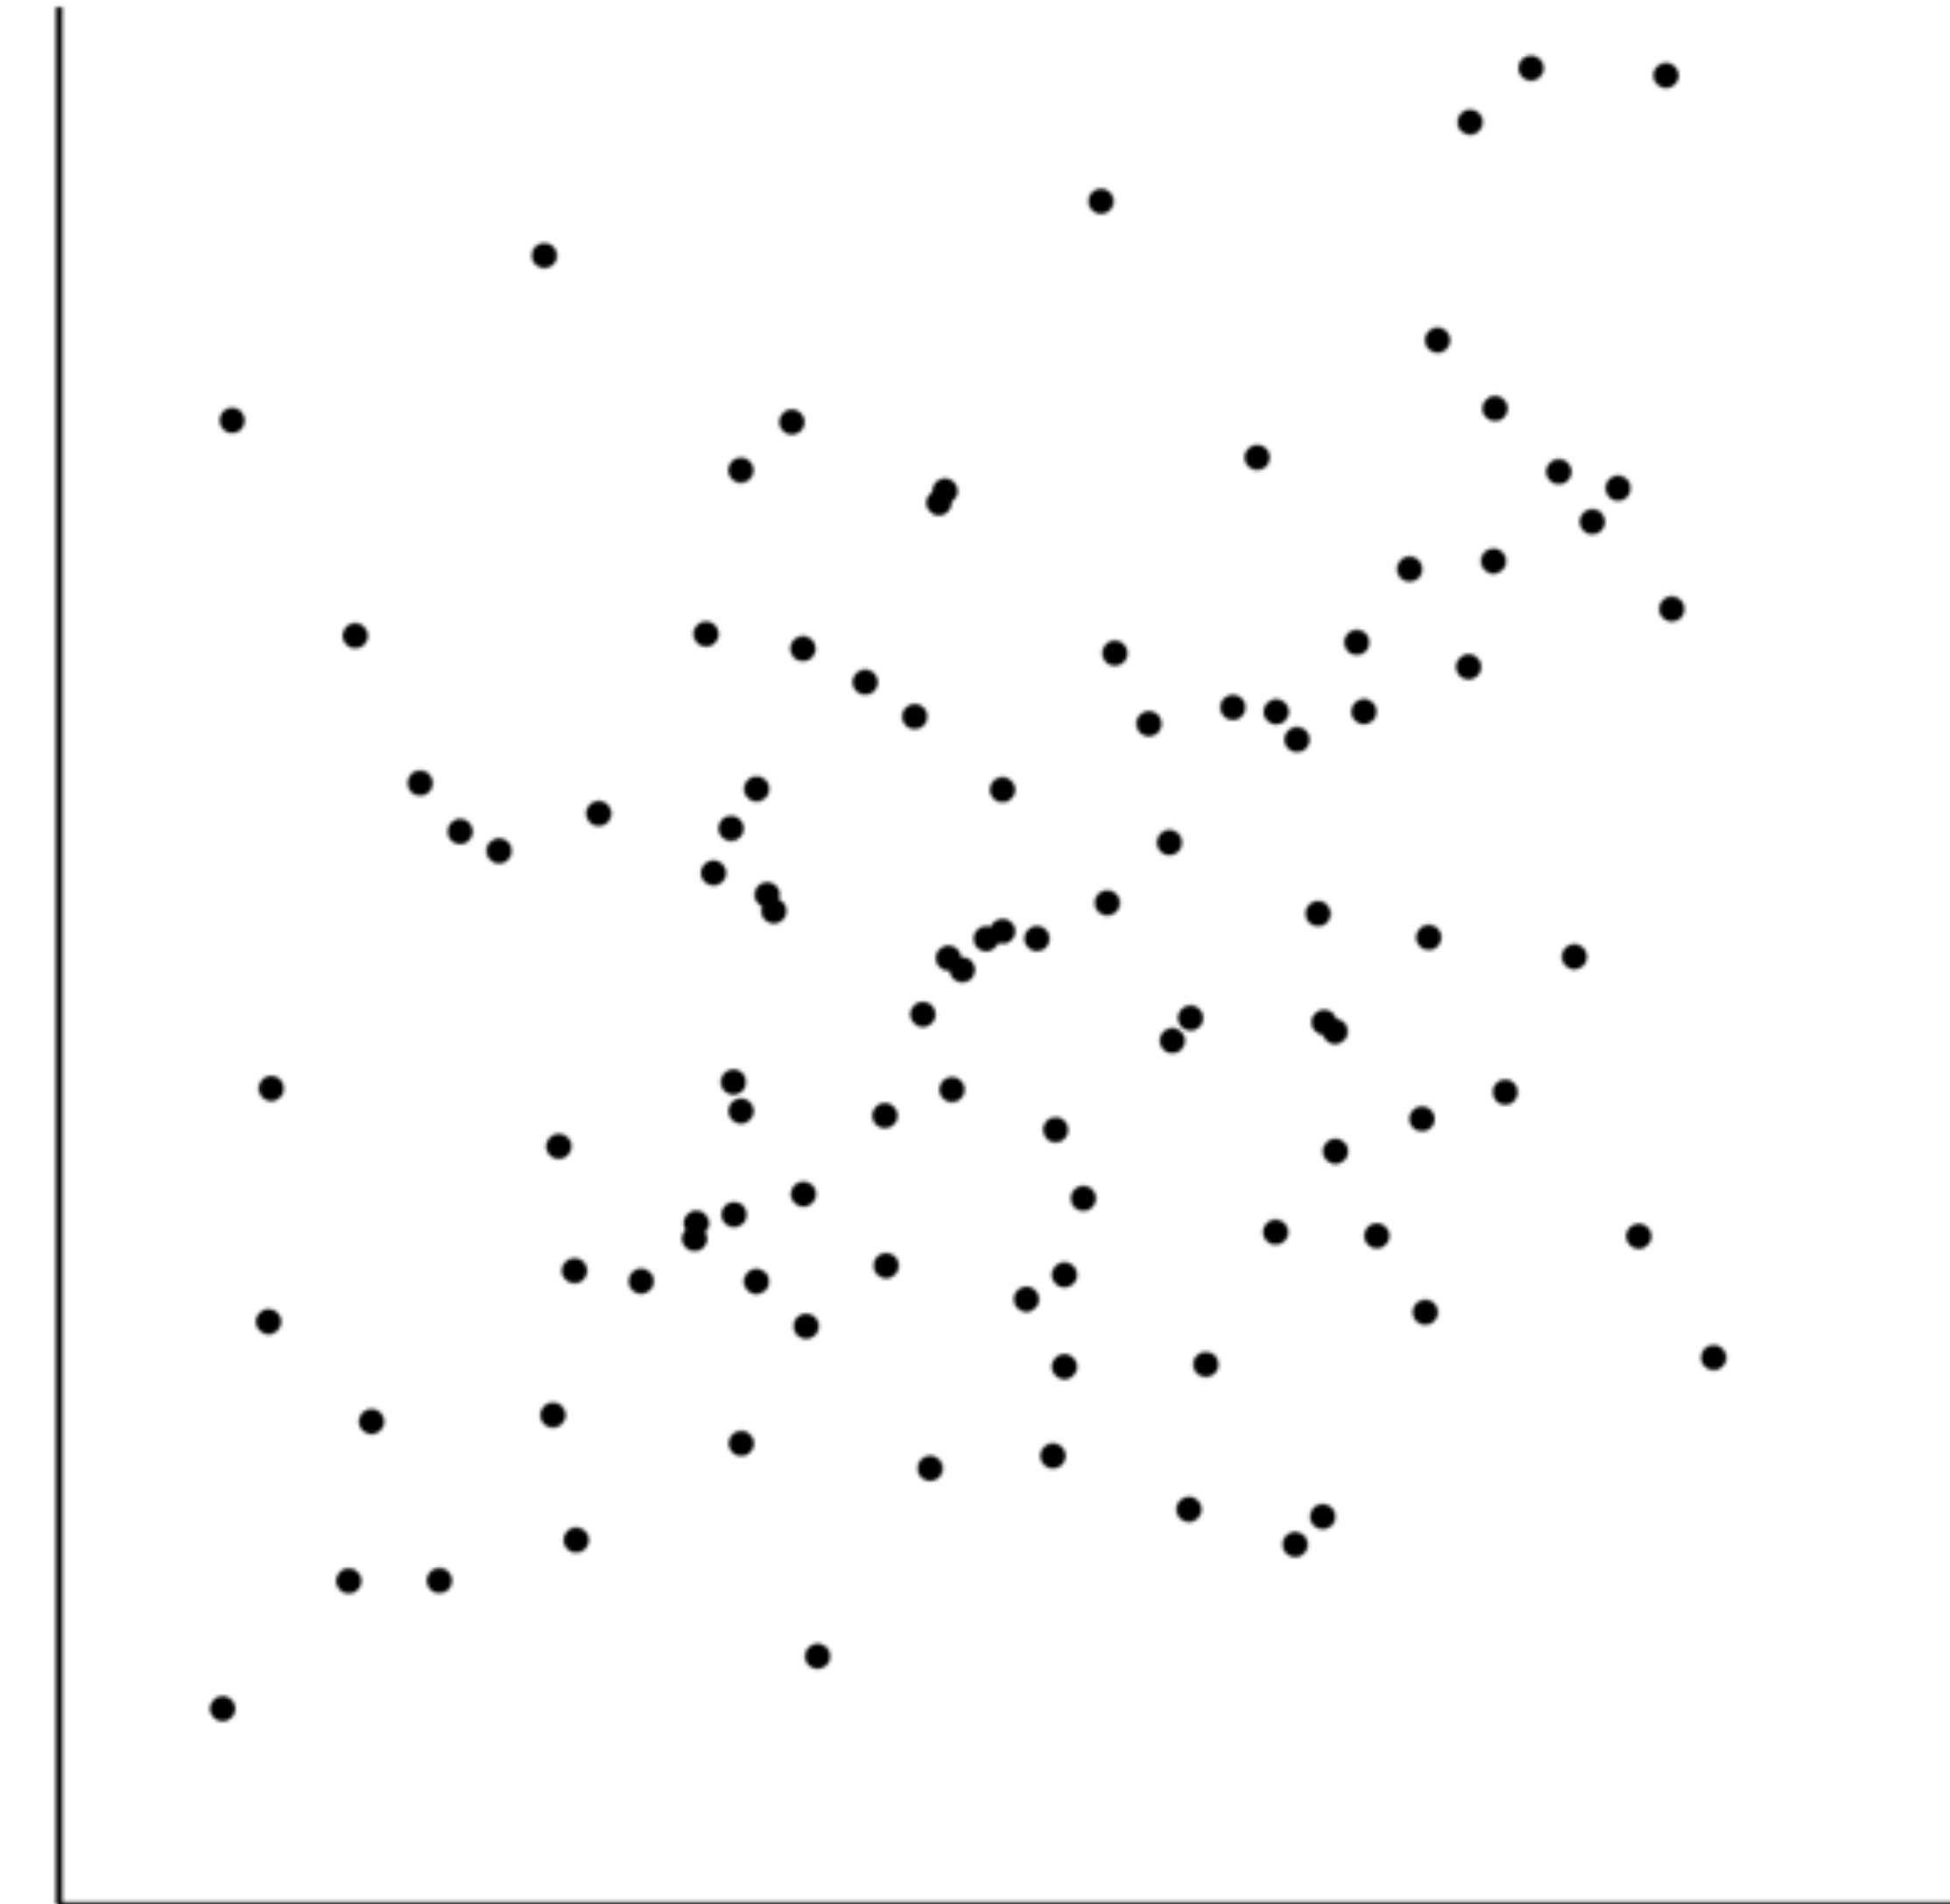

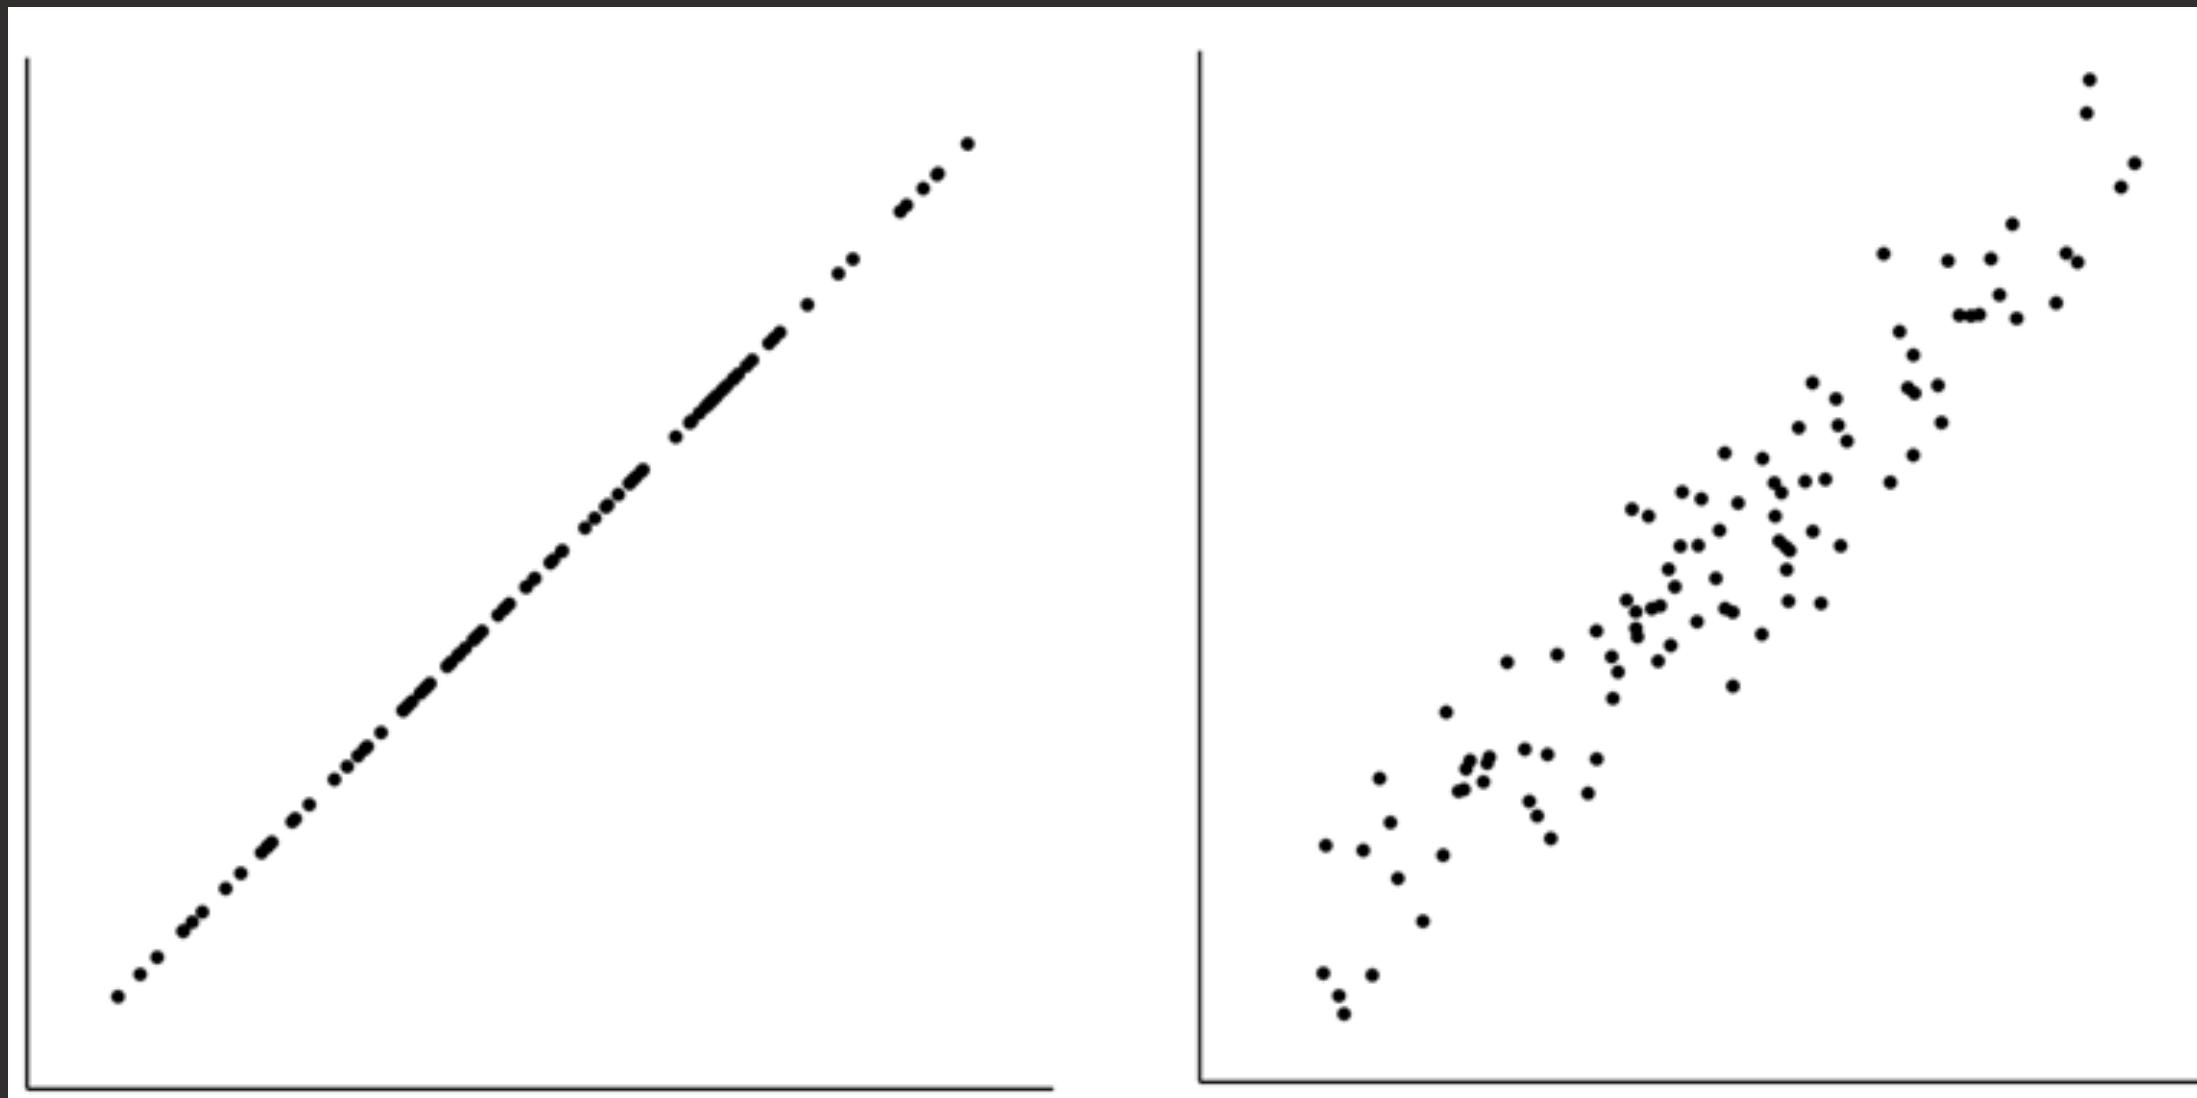

$r = 0.35$

$r = 0.3$

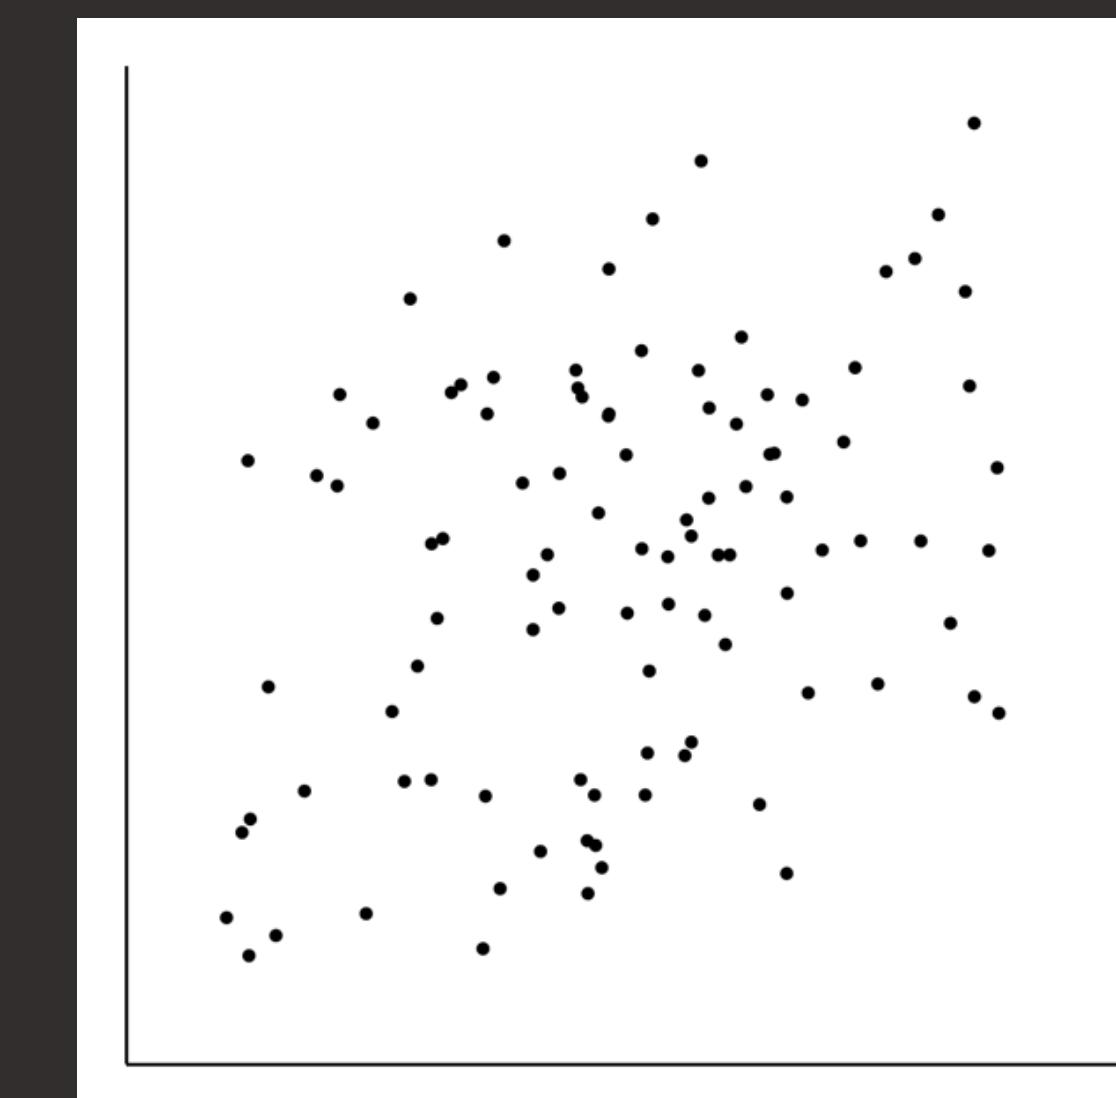

Same difference but harder, why?

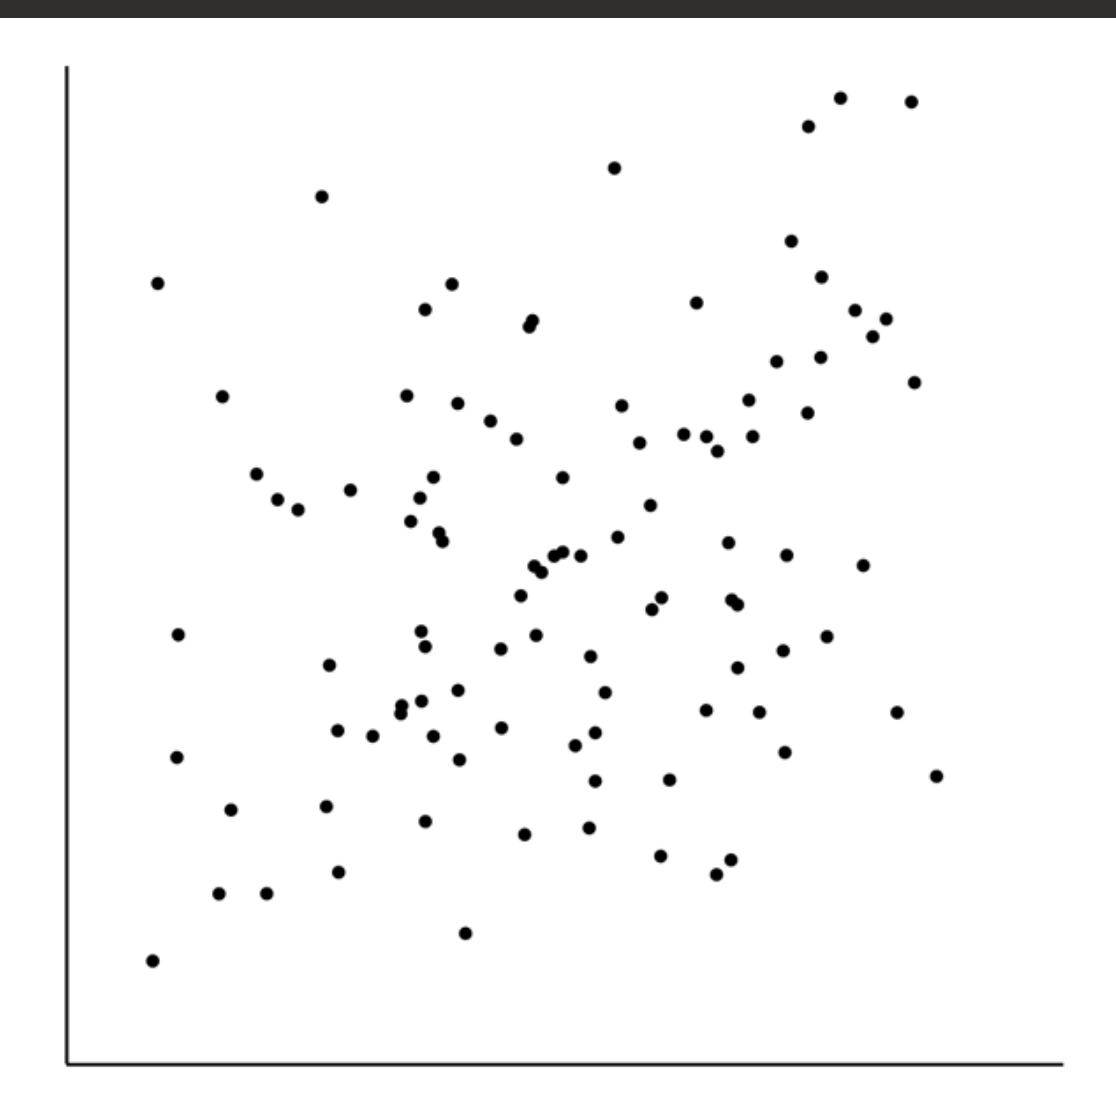

1.0

0.95

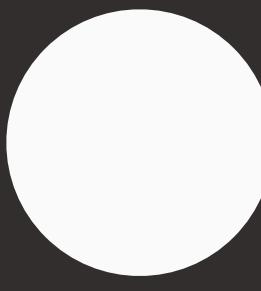

0.35

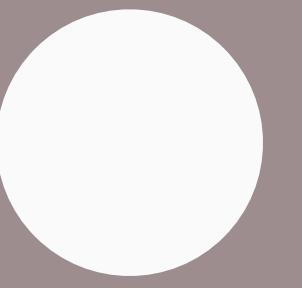

0.3

*just-noticeable
differences (jnd)*

*imagine yourself in
a dark room...*

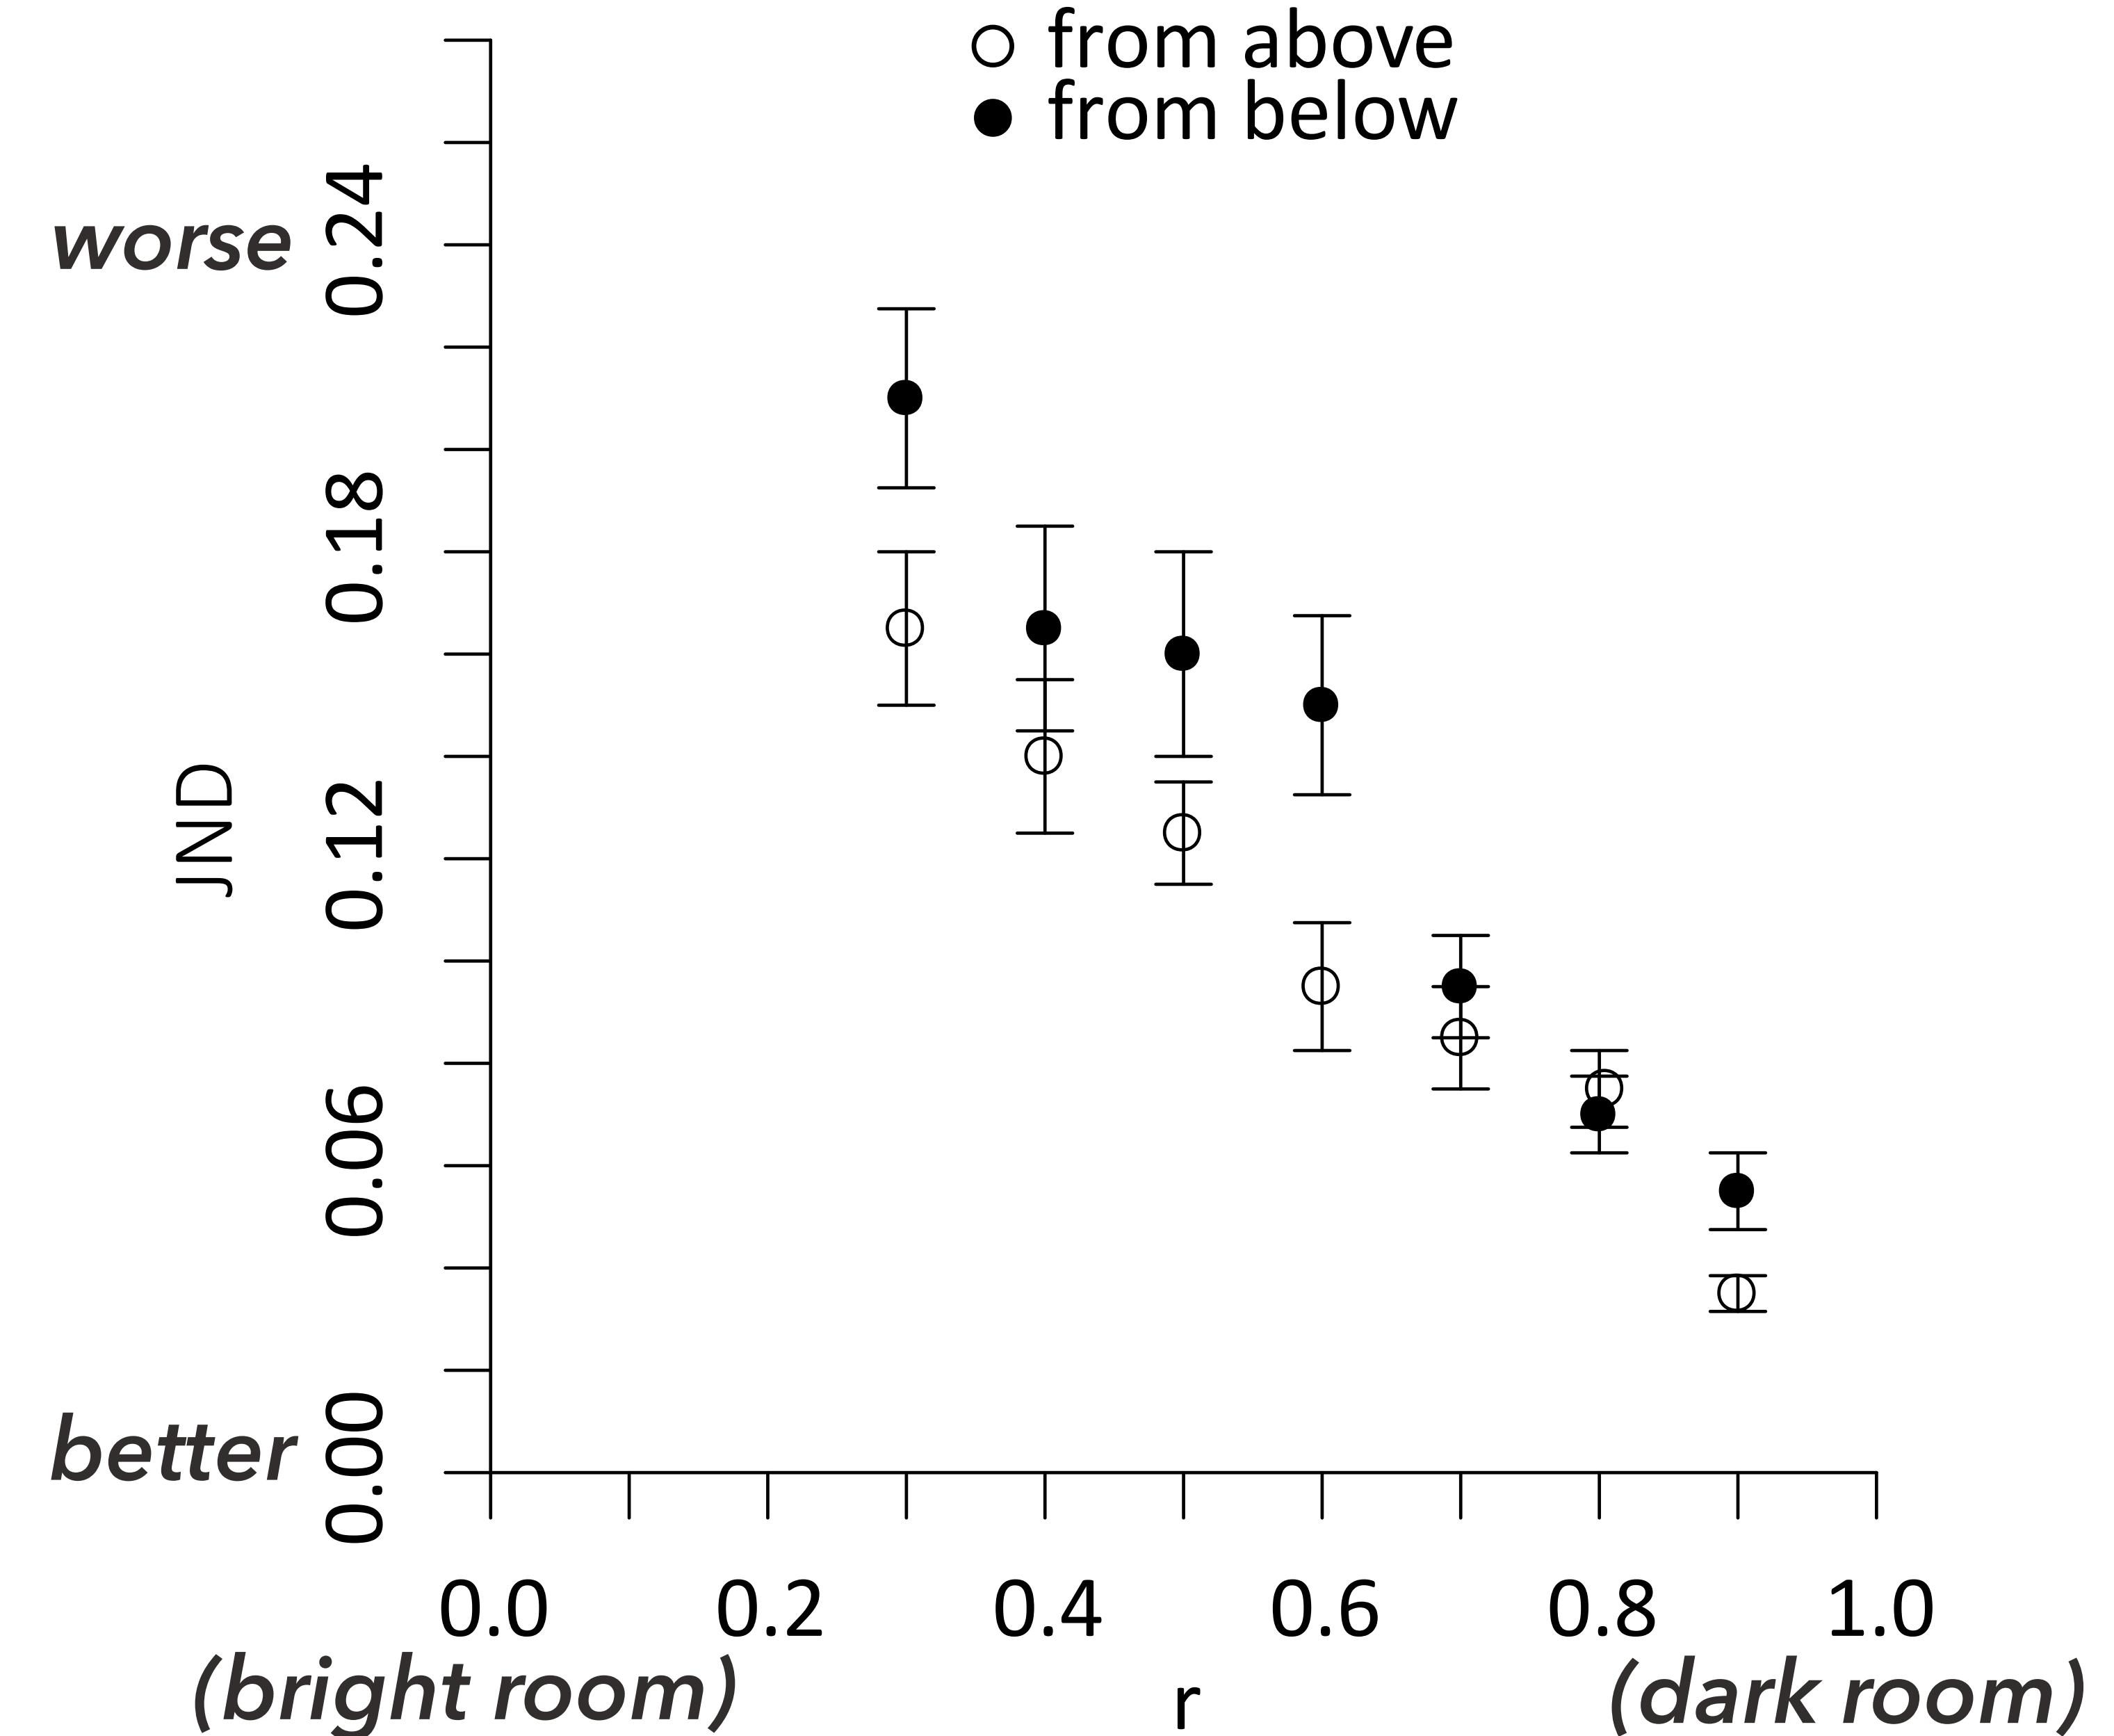

*JND: the smallest difference
necessary to perceive two stimuli
as being different.*

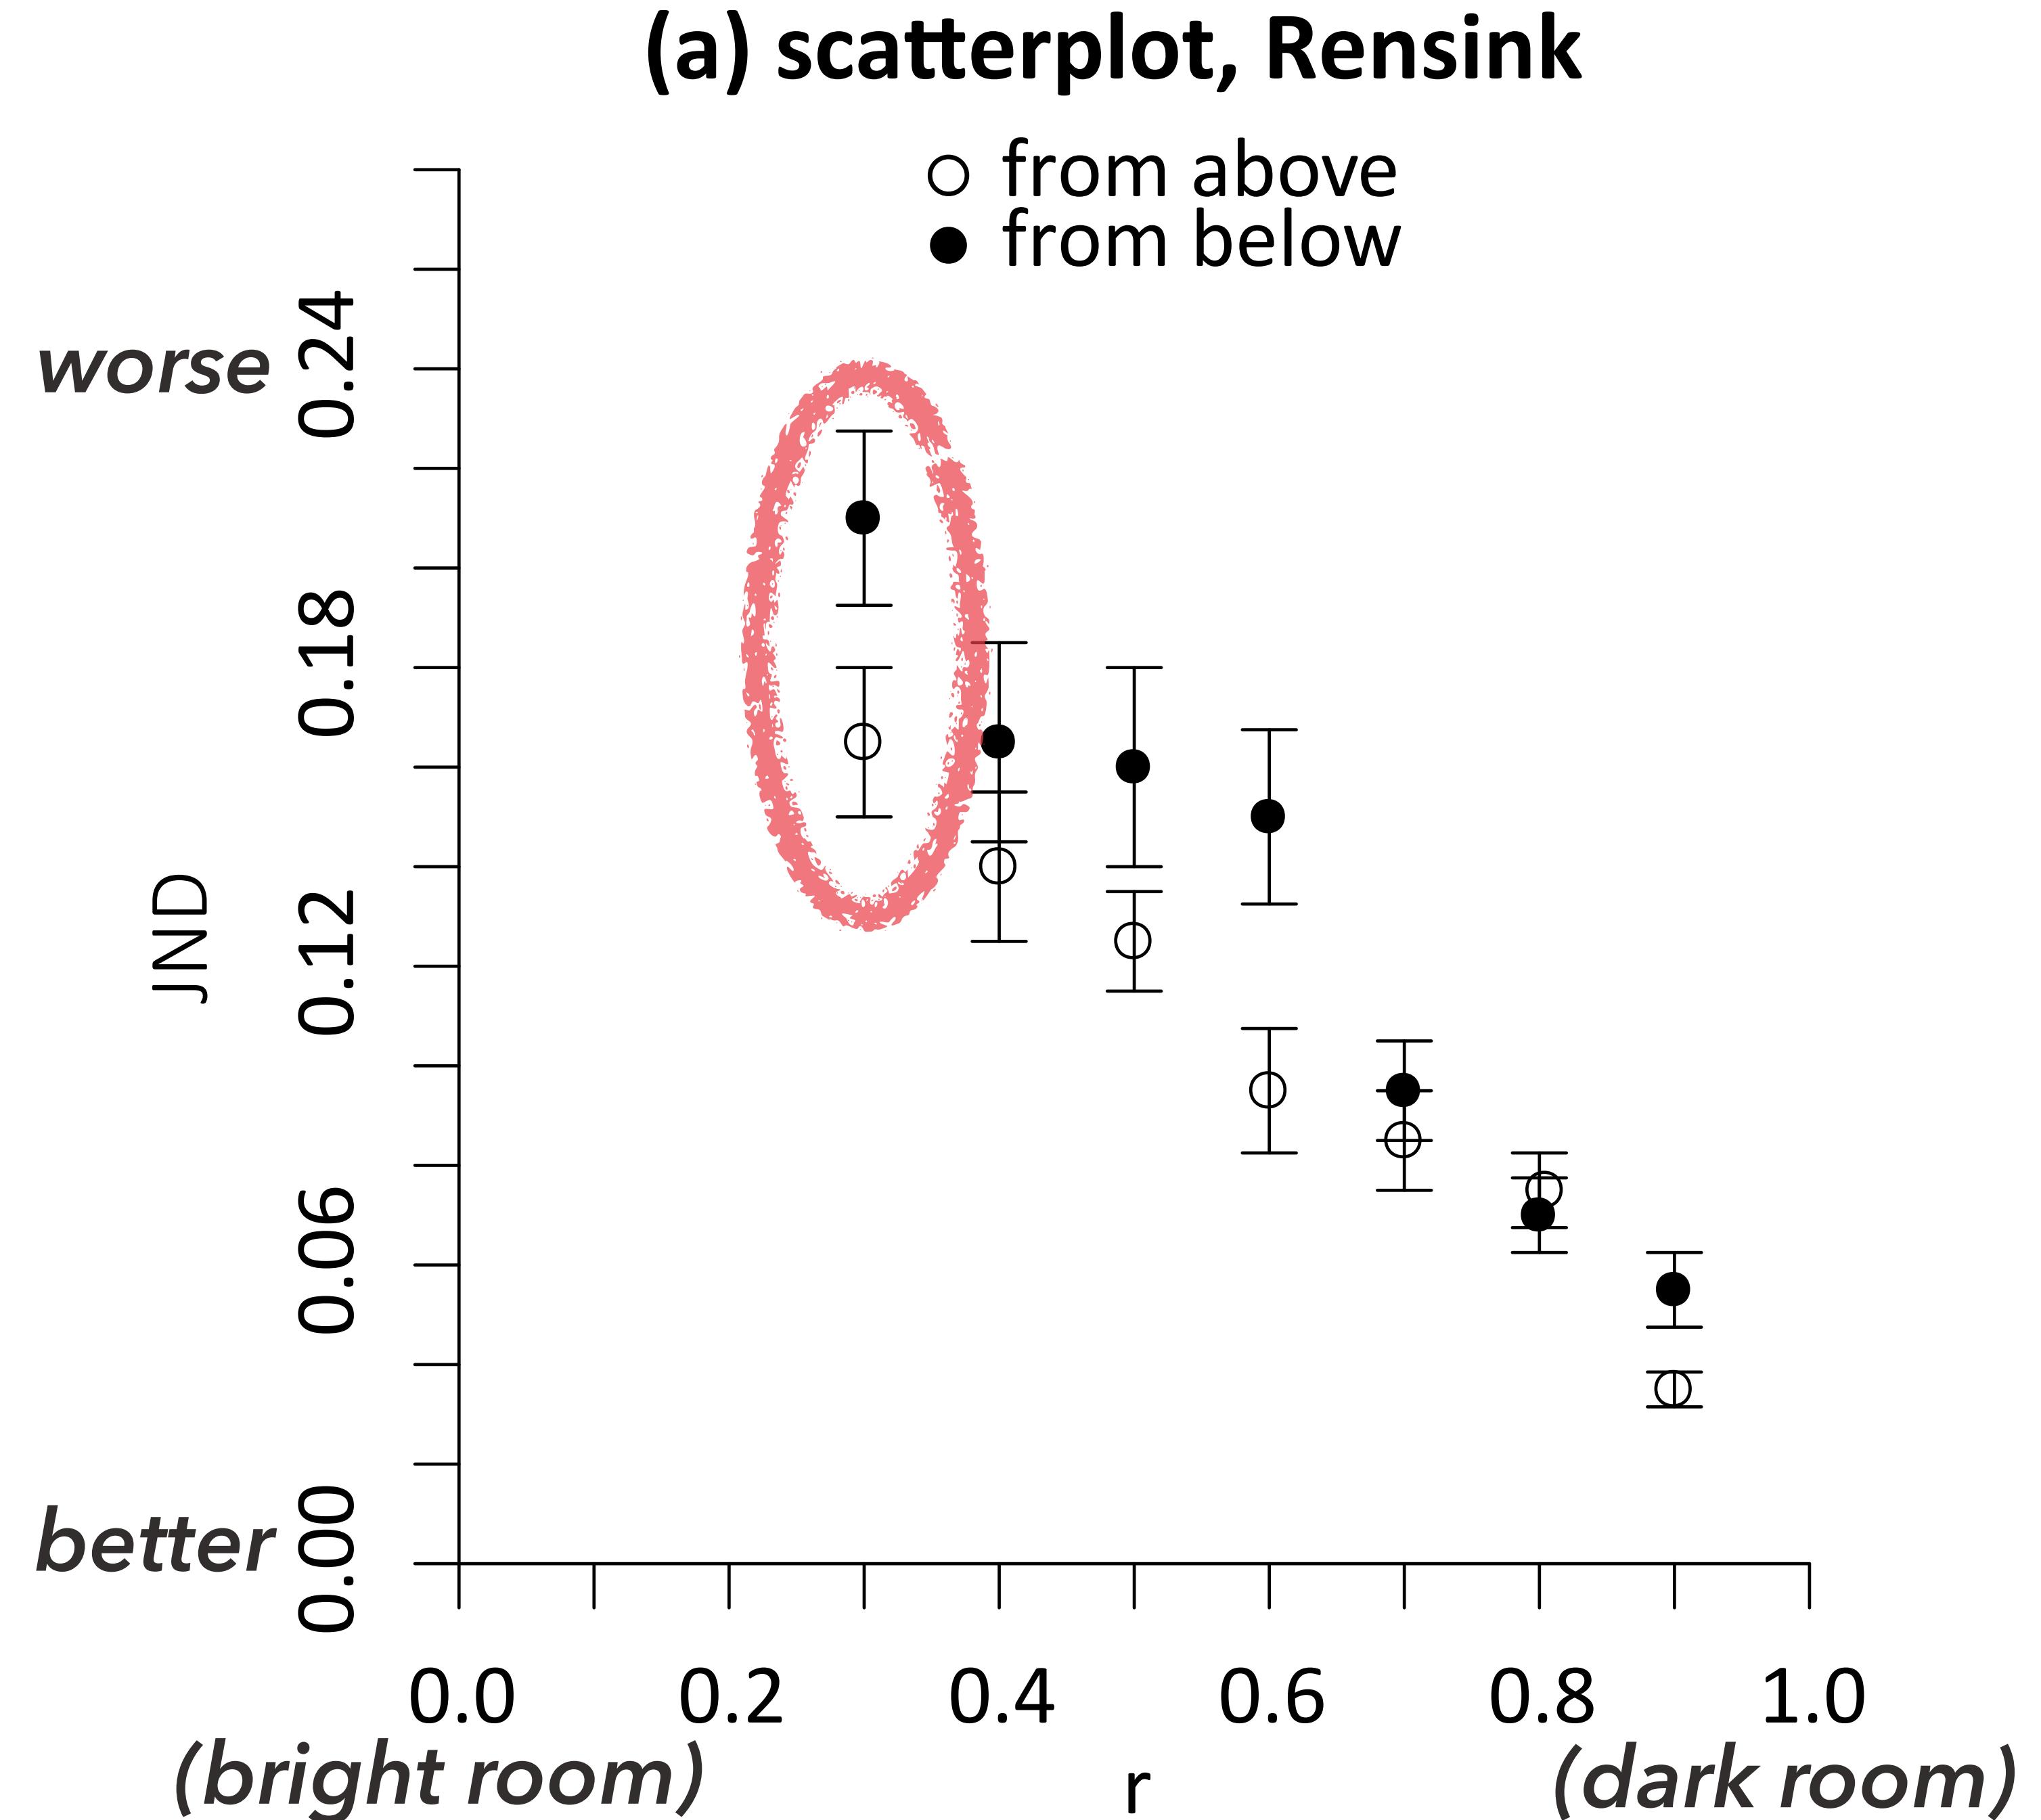

after many trials...

*Rensink plotted
JND as a function
of correlation (r)*

(a) scatterplot, Rensink

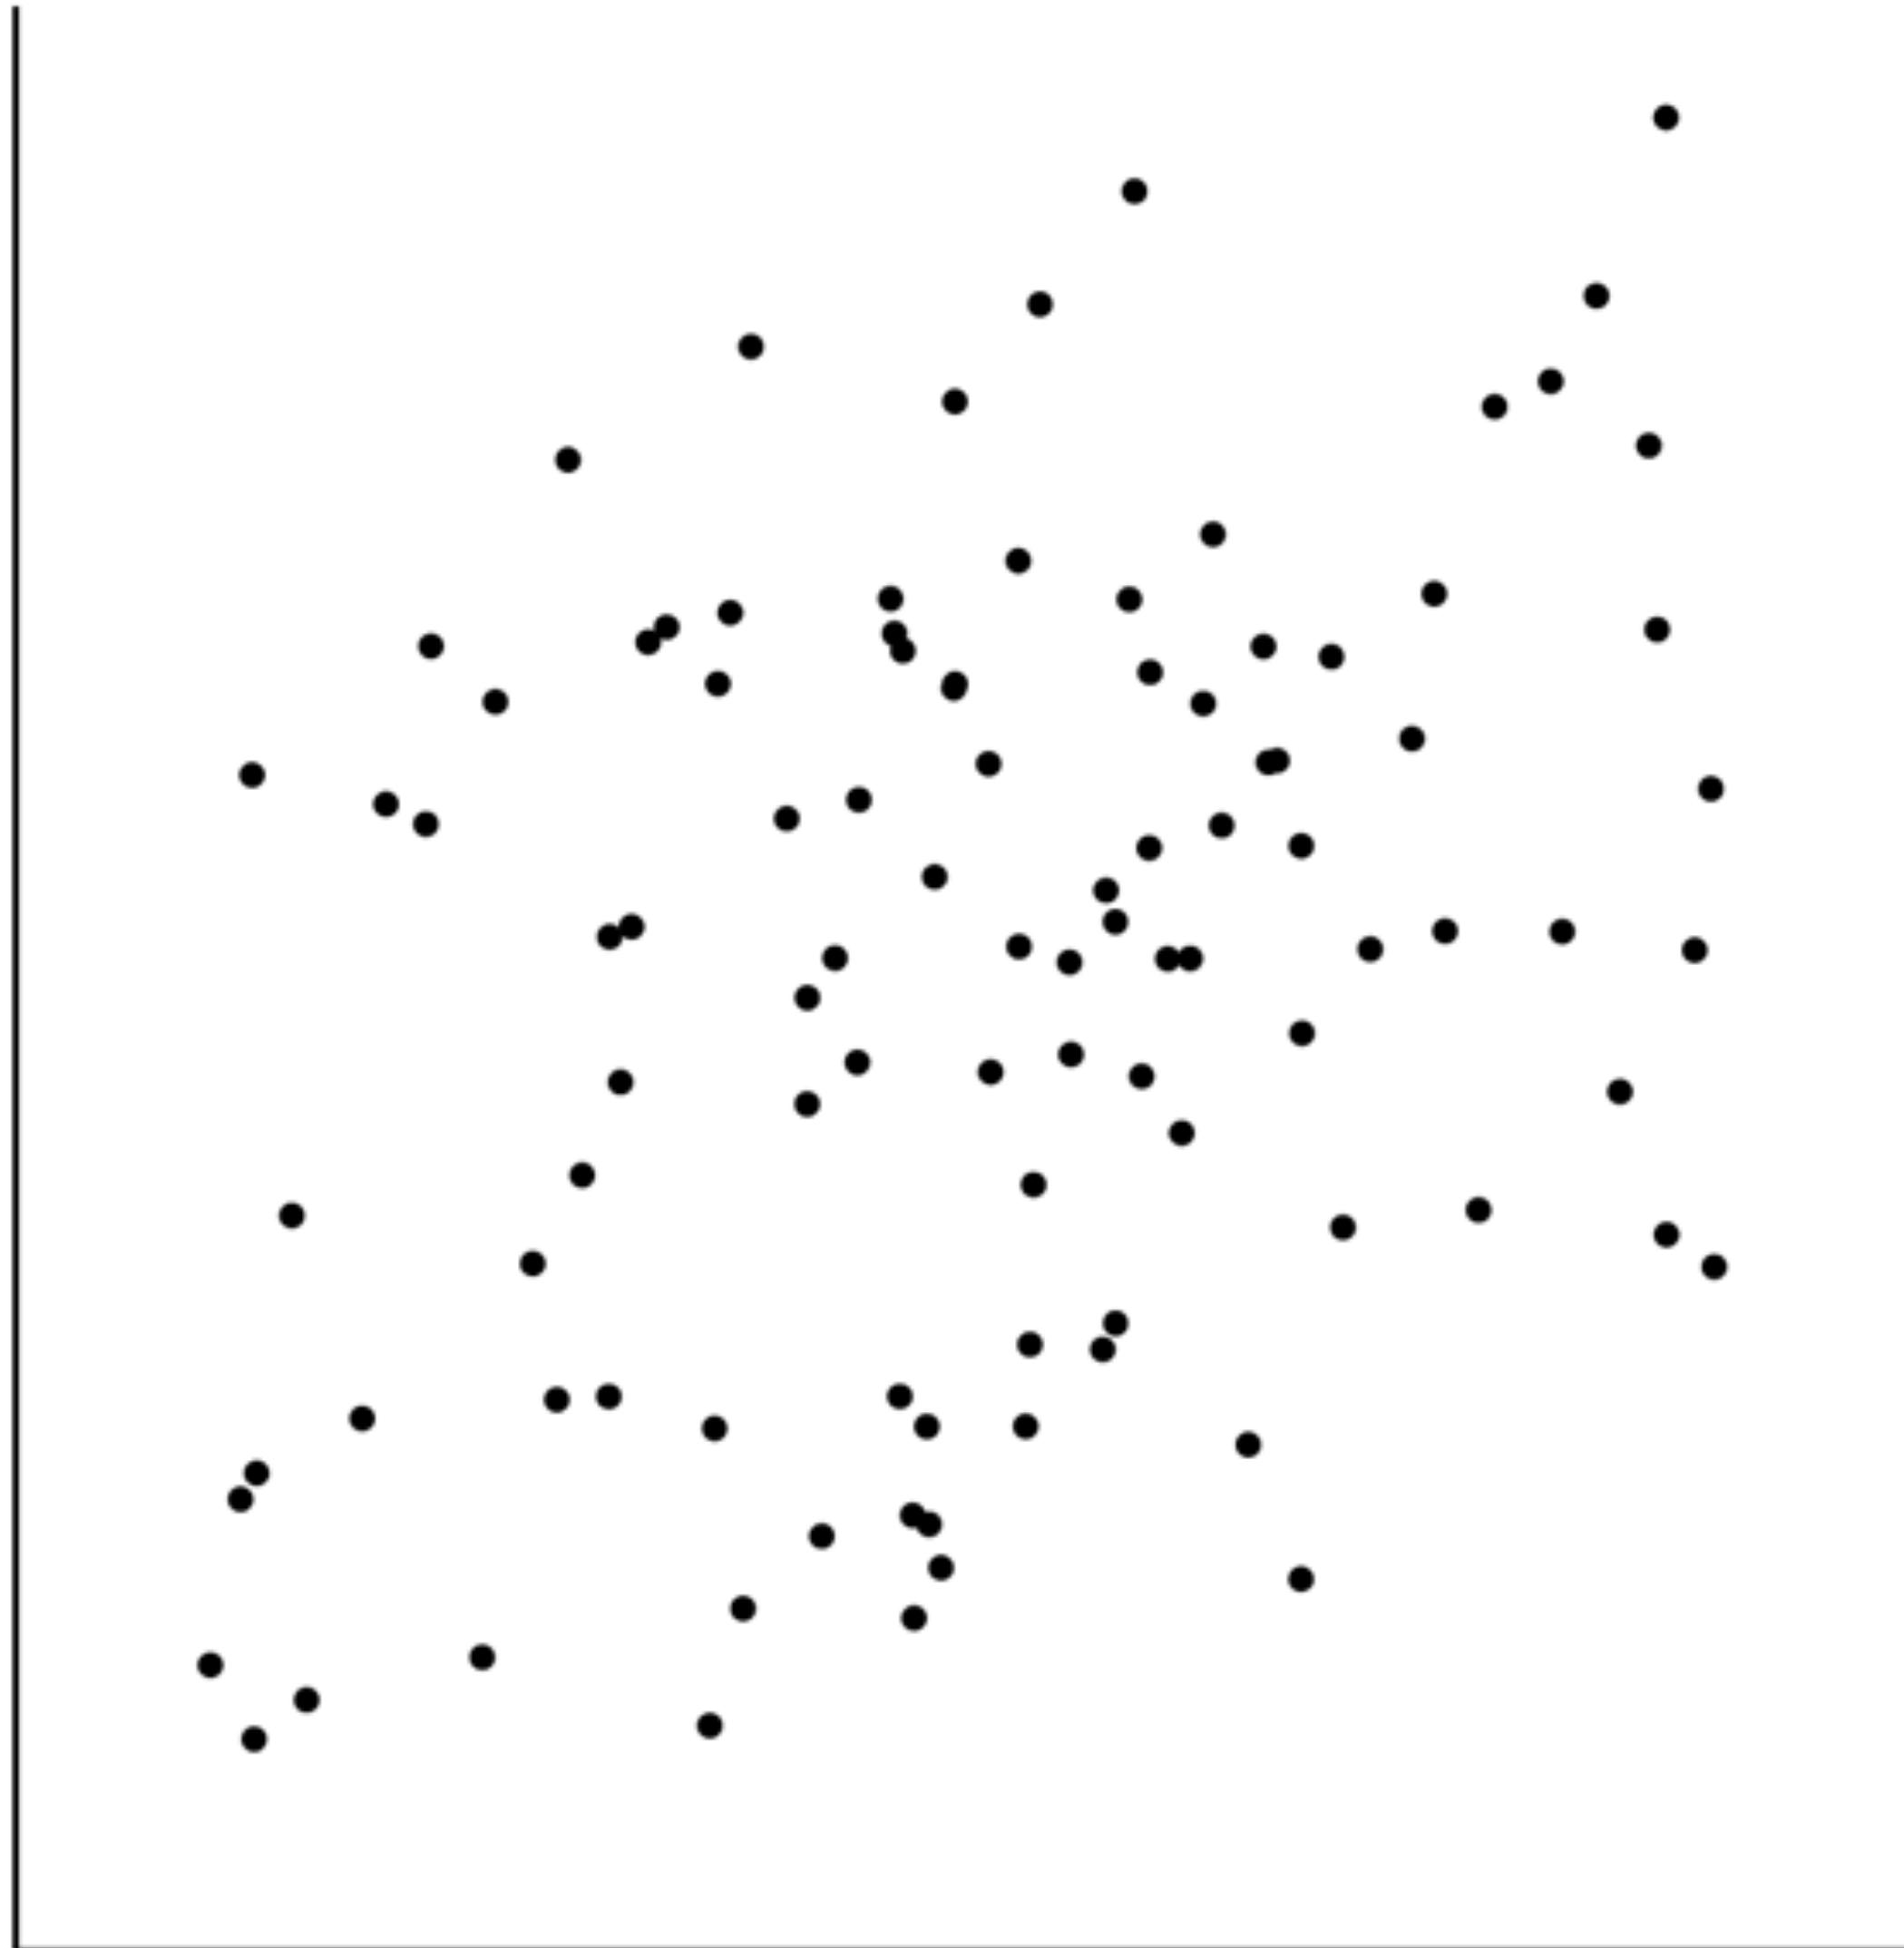

*To see a difference
in data with
correlation of 0.3,
the comparison r
must be +/- 0.2.*

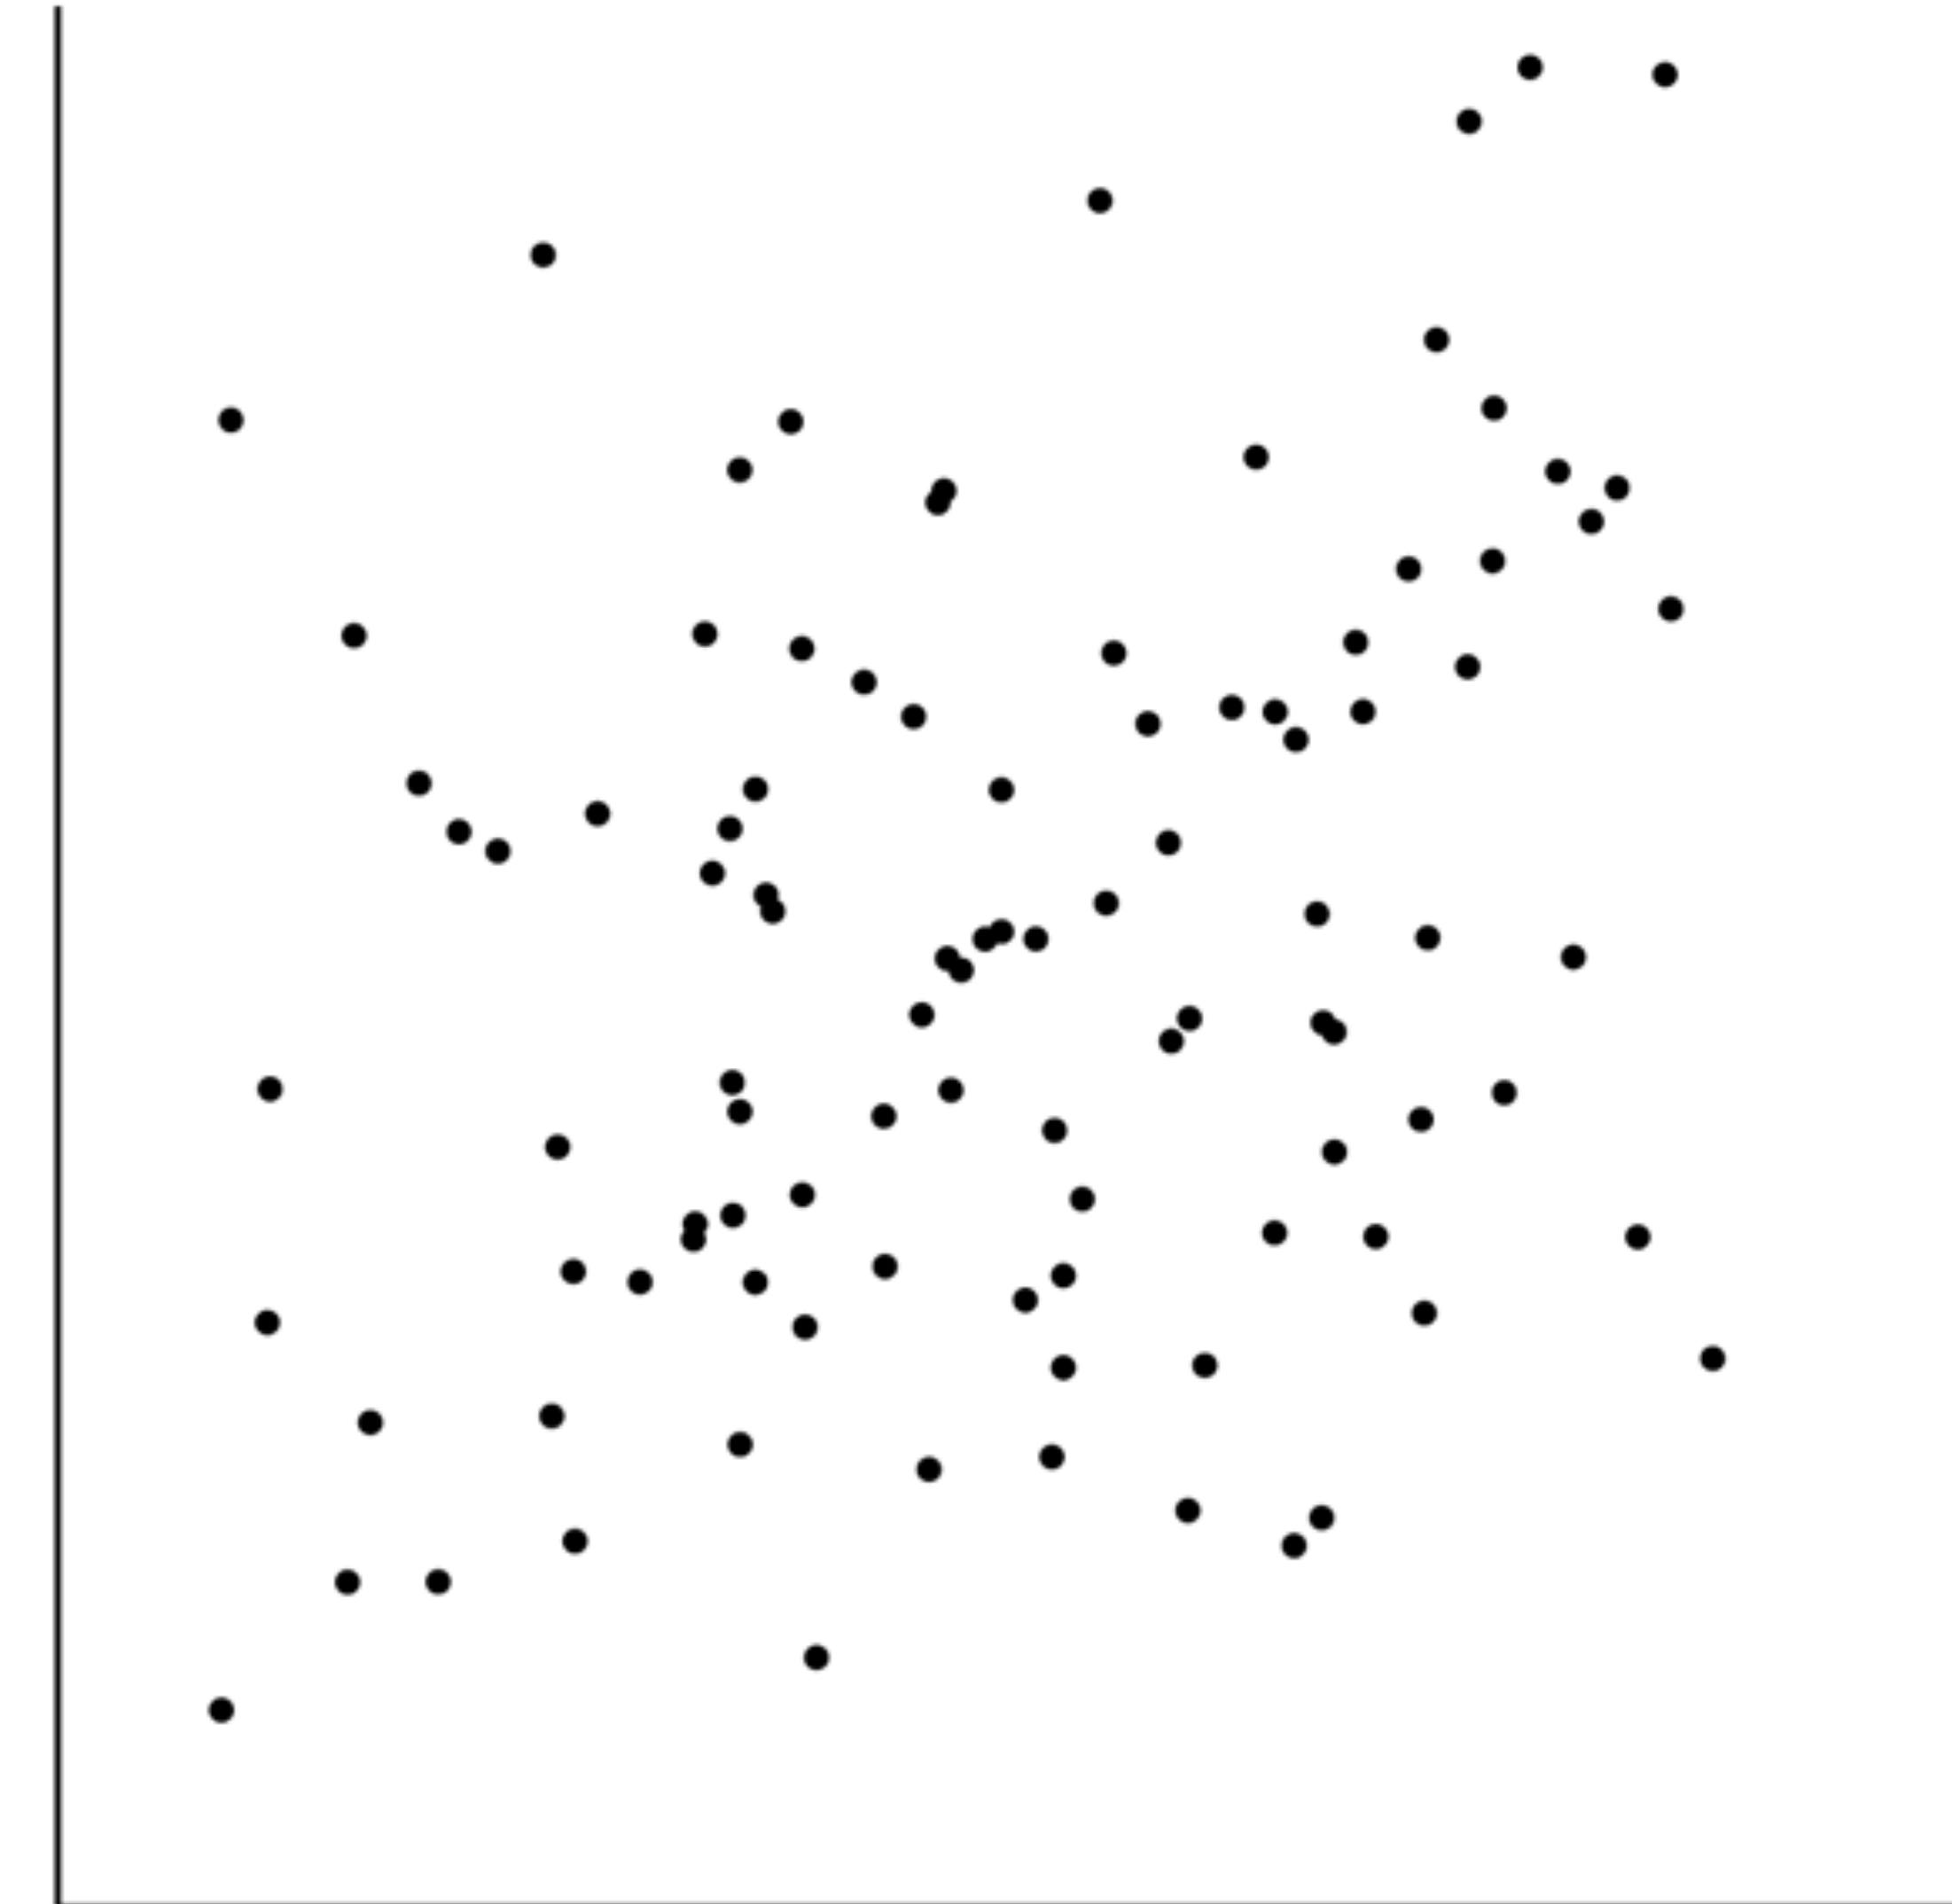

$r = 0.35$

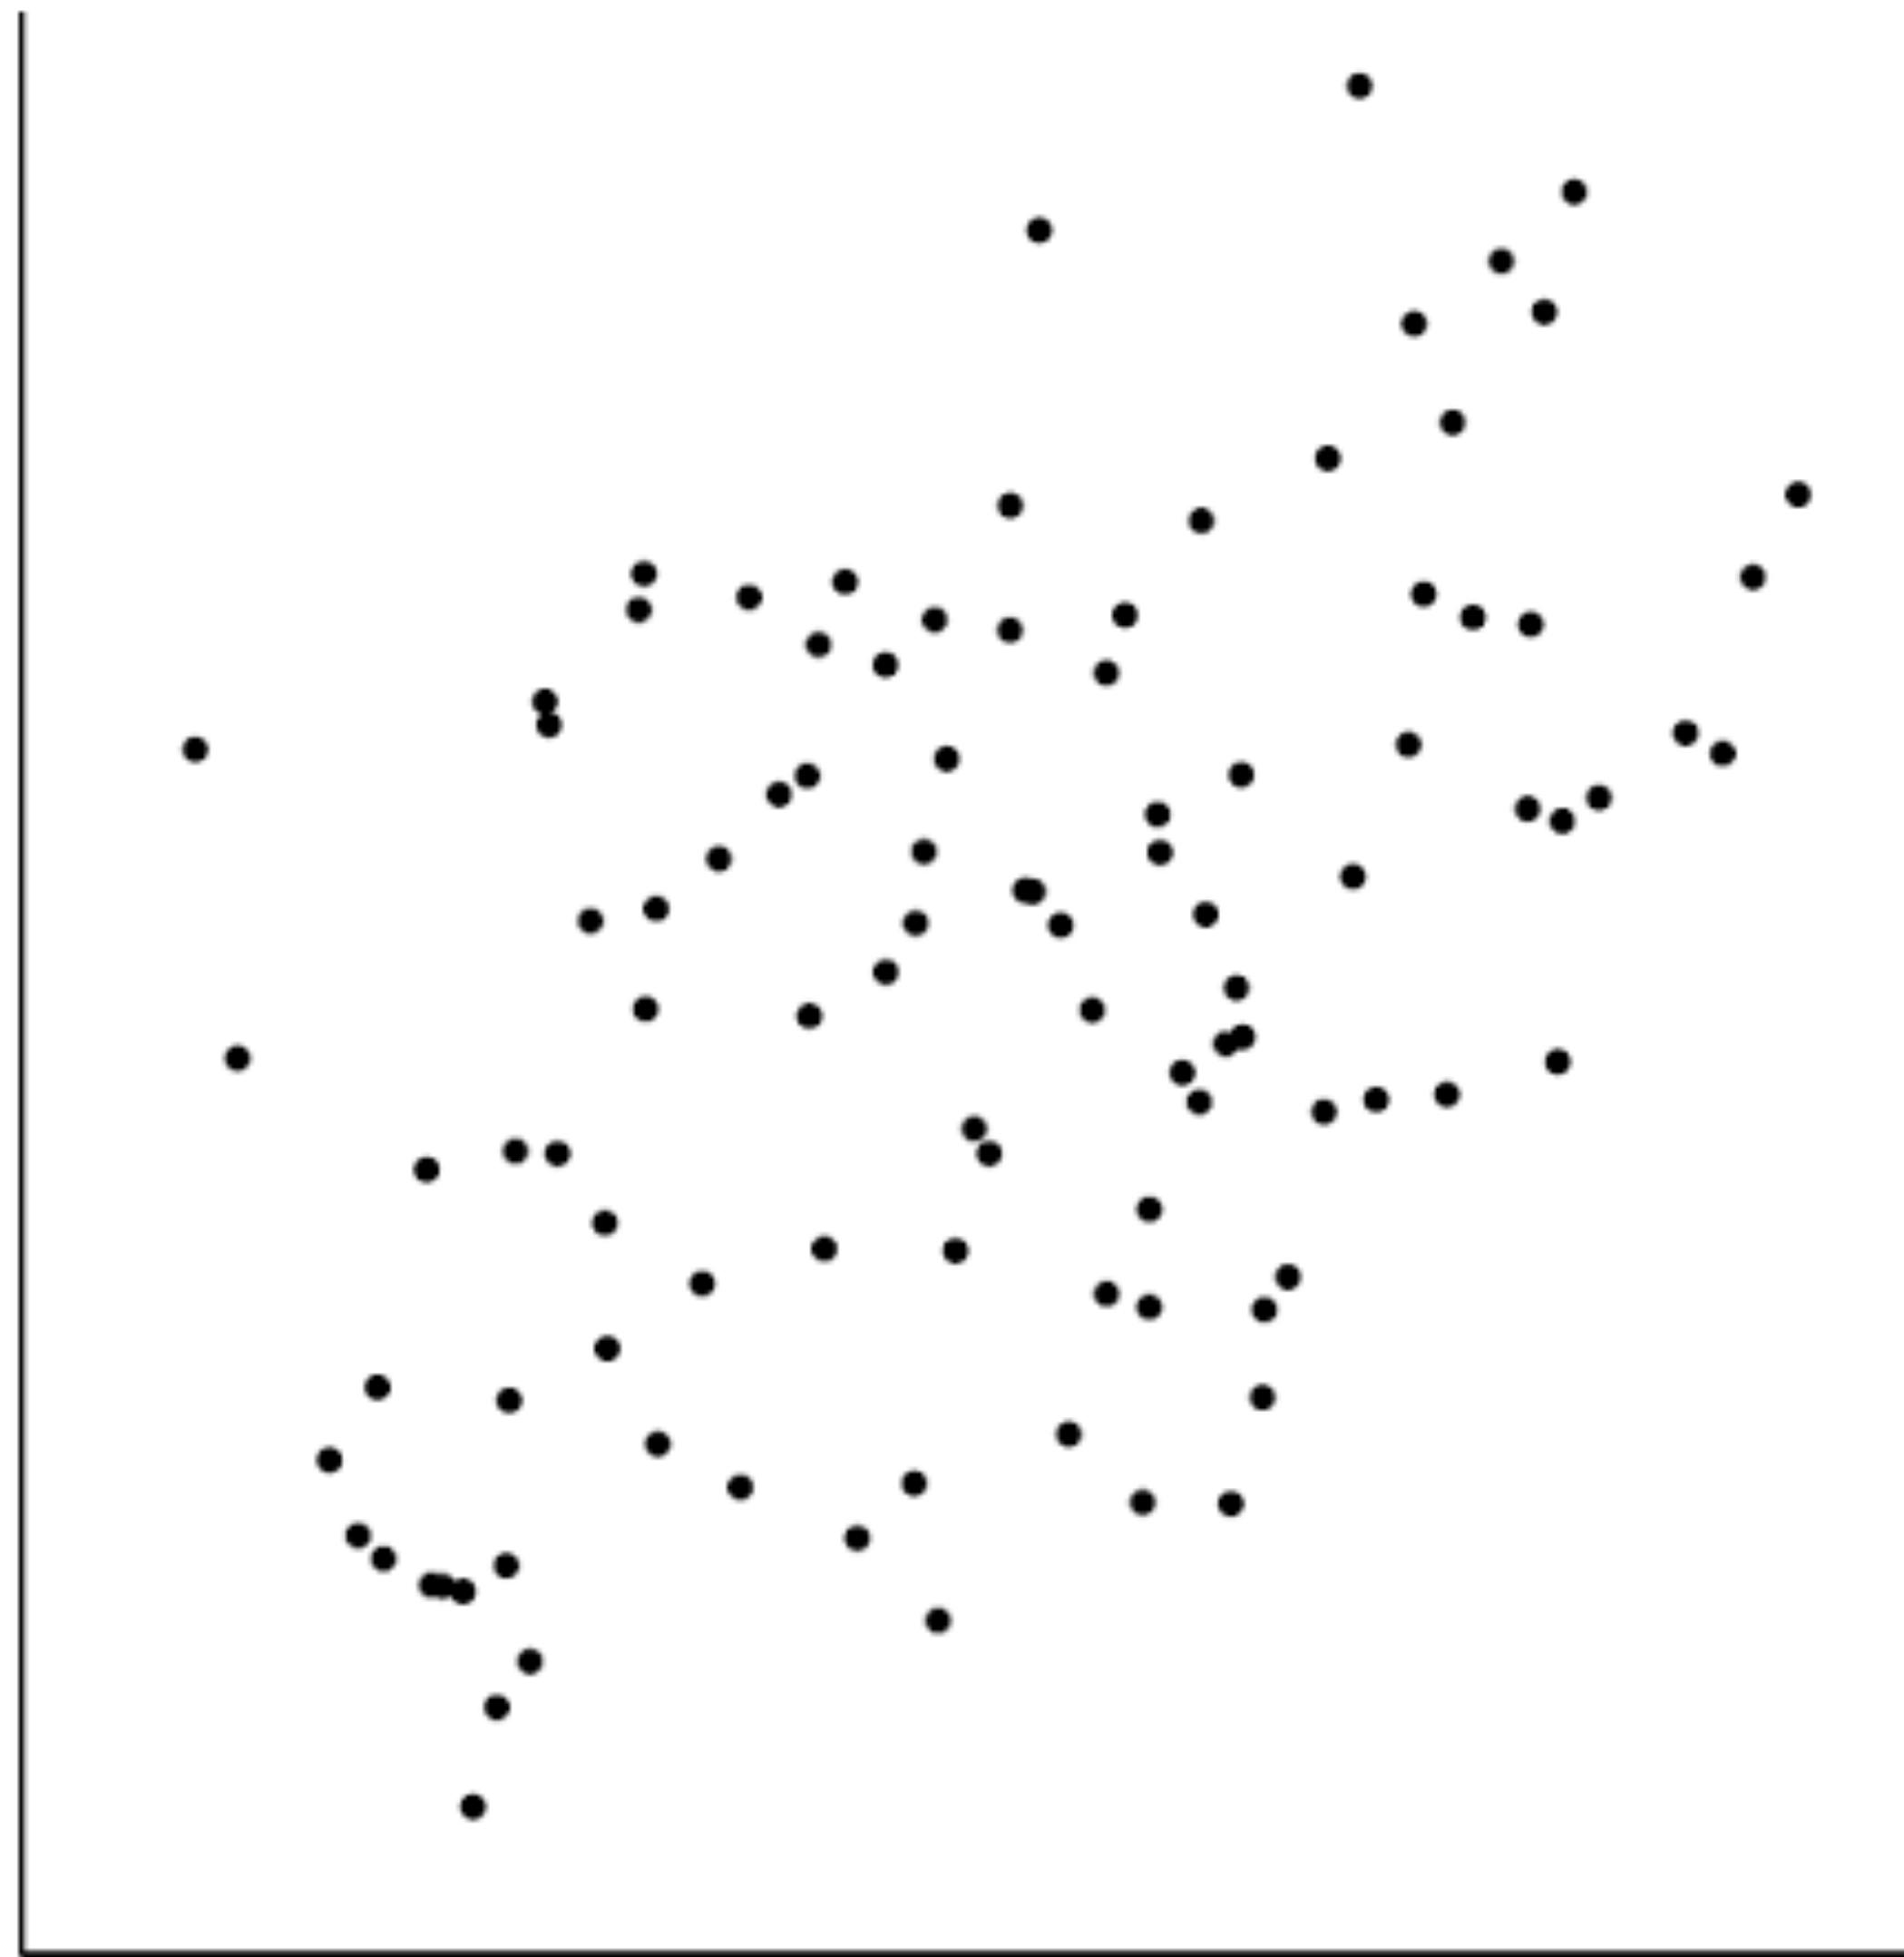

*To see a diff,
increase to 0.5!*

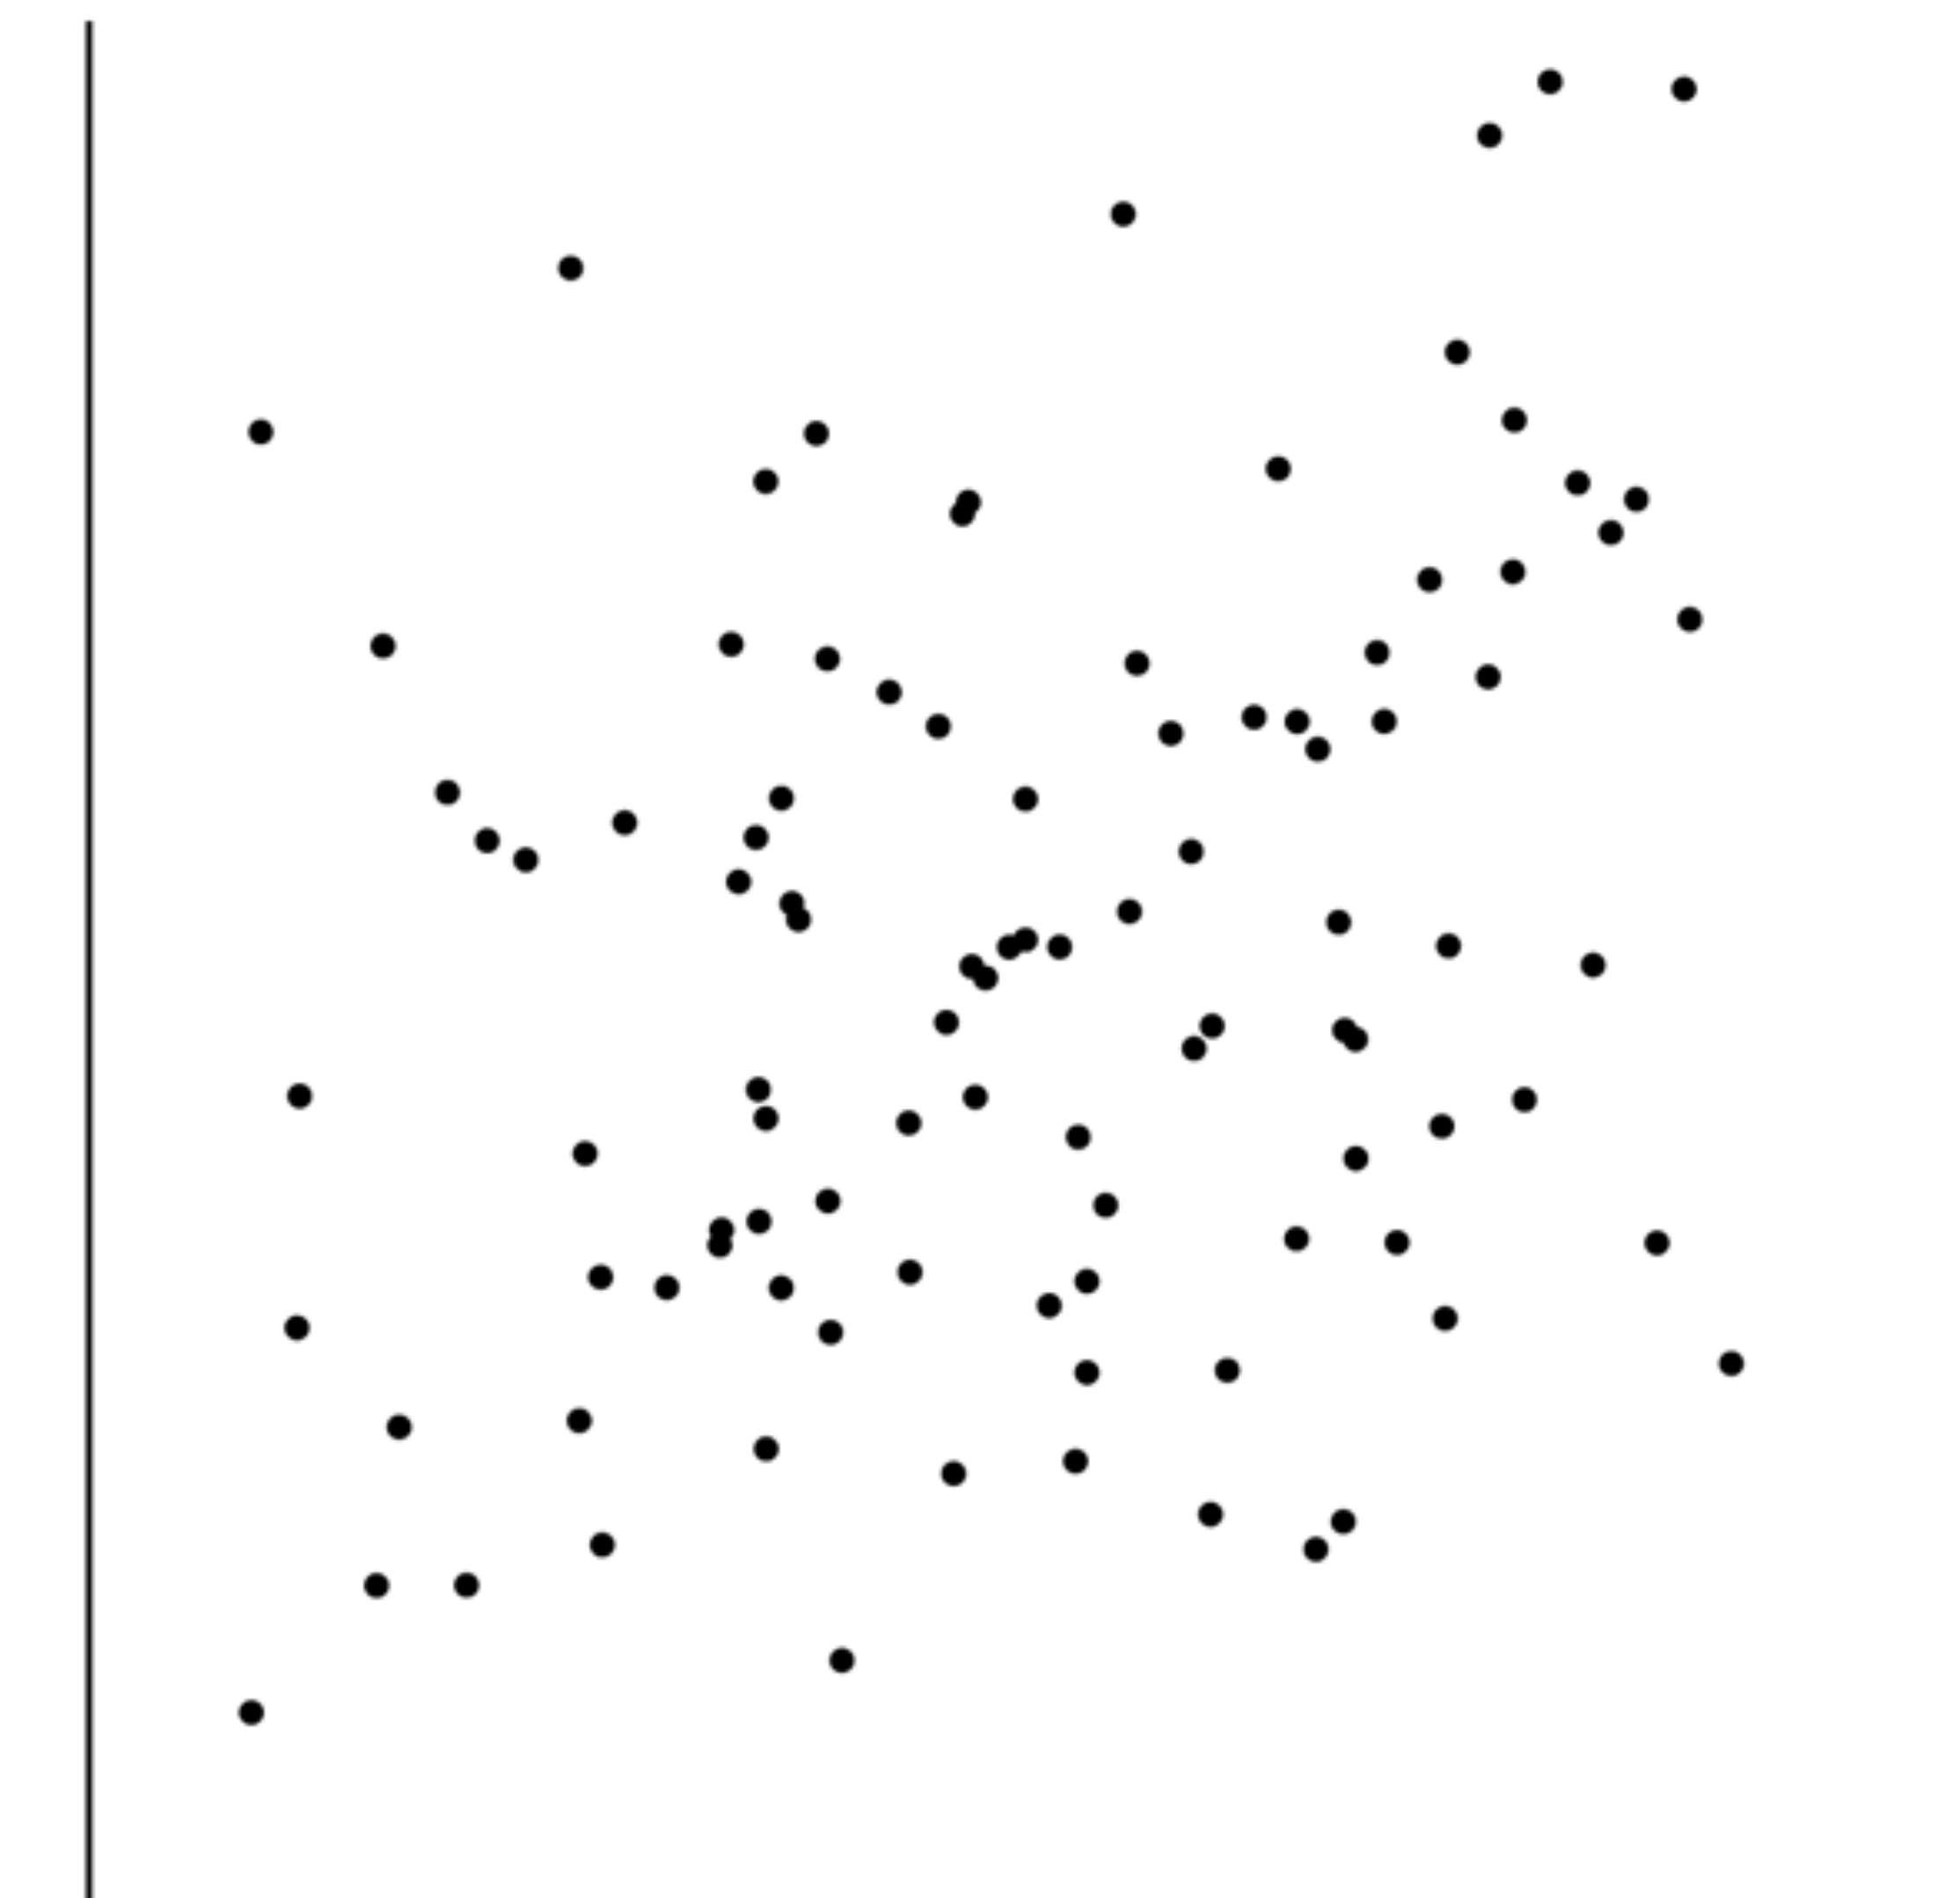

$r = 0.3$

$r = 0.5$

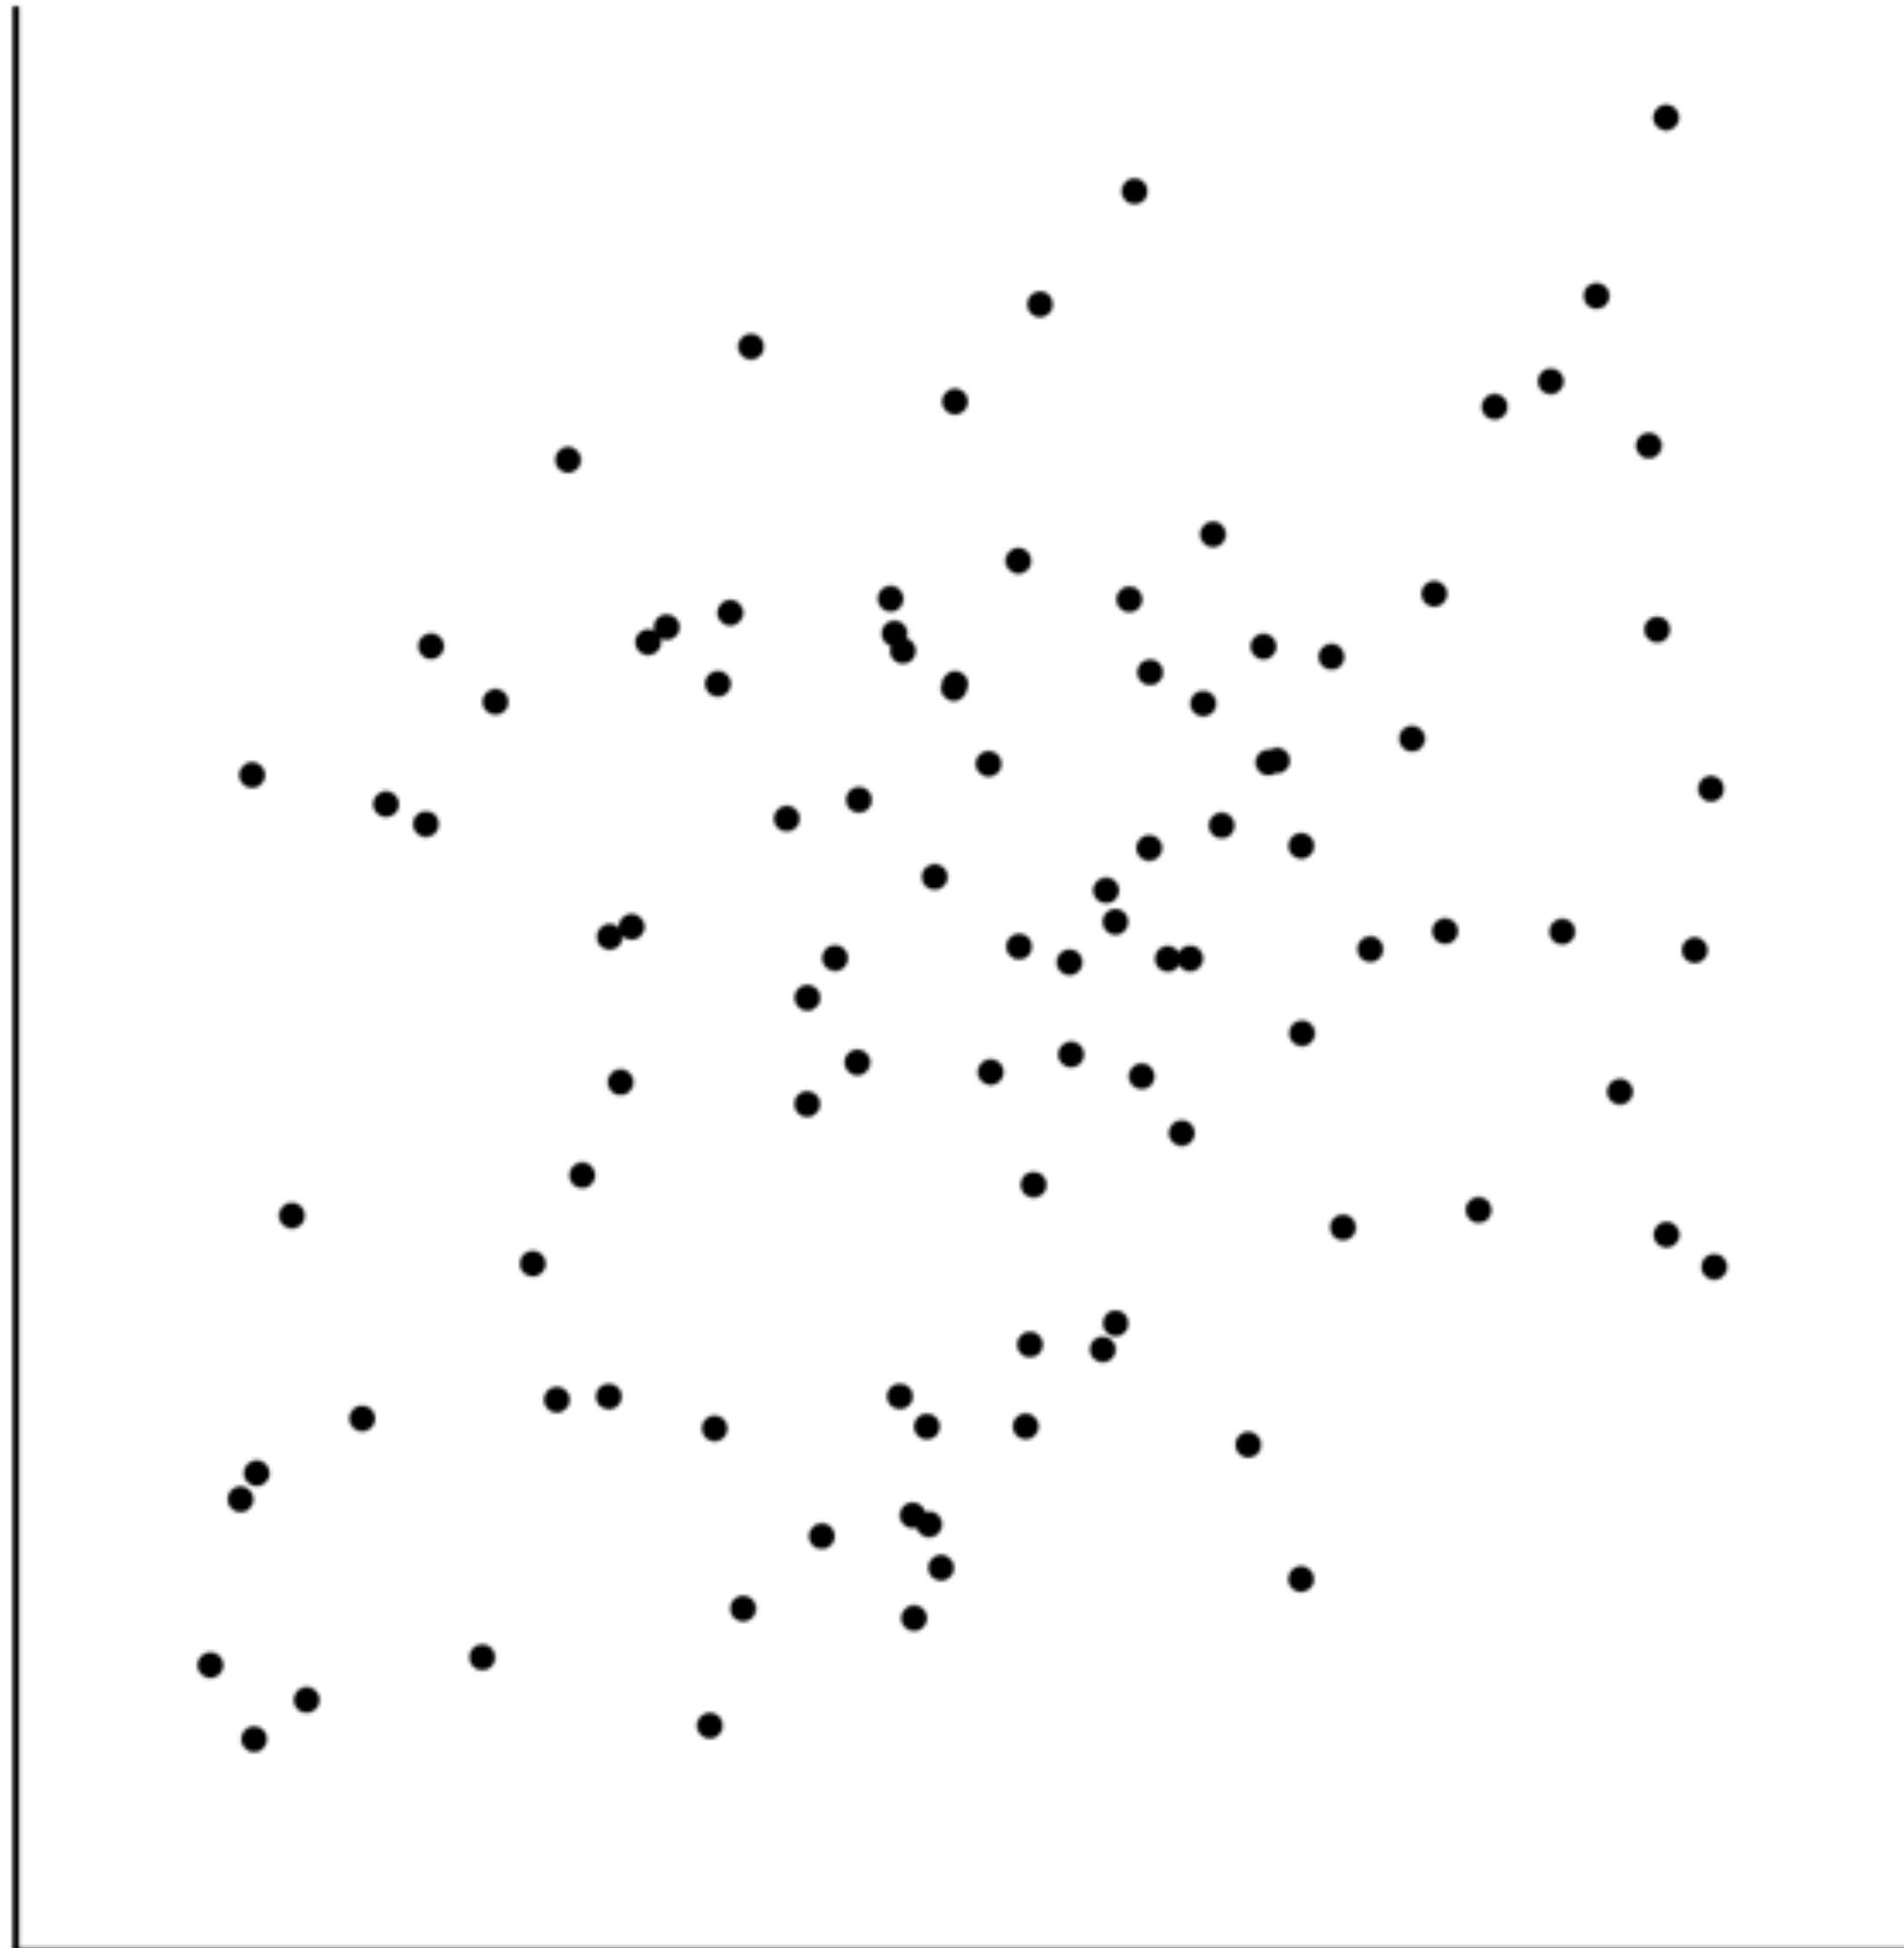

$r = 0.3$

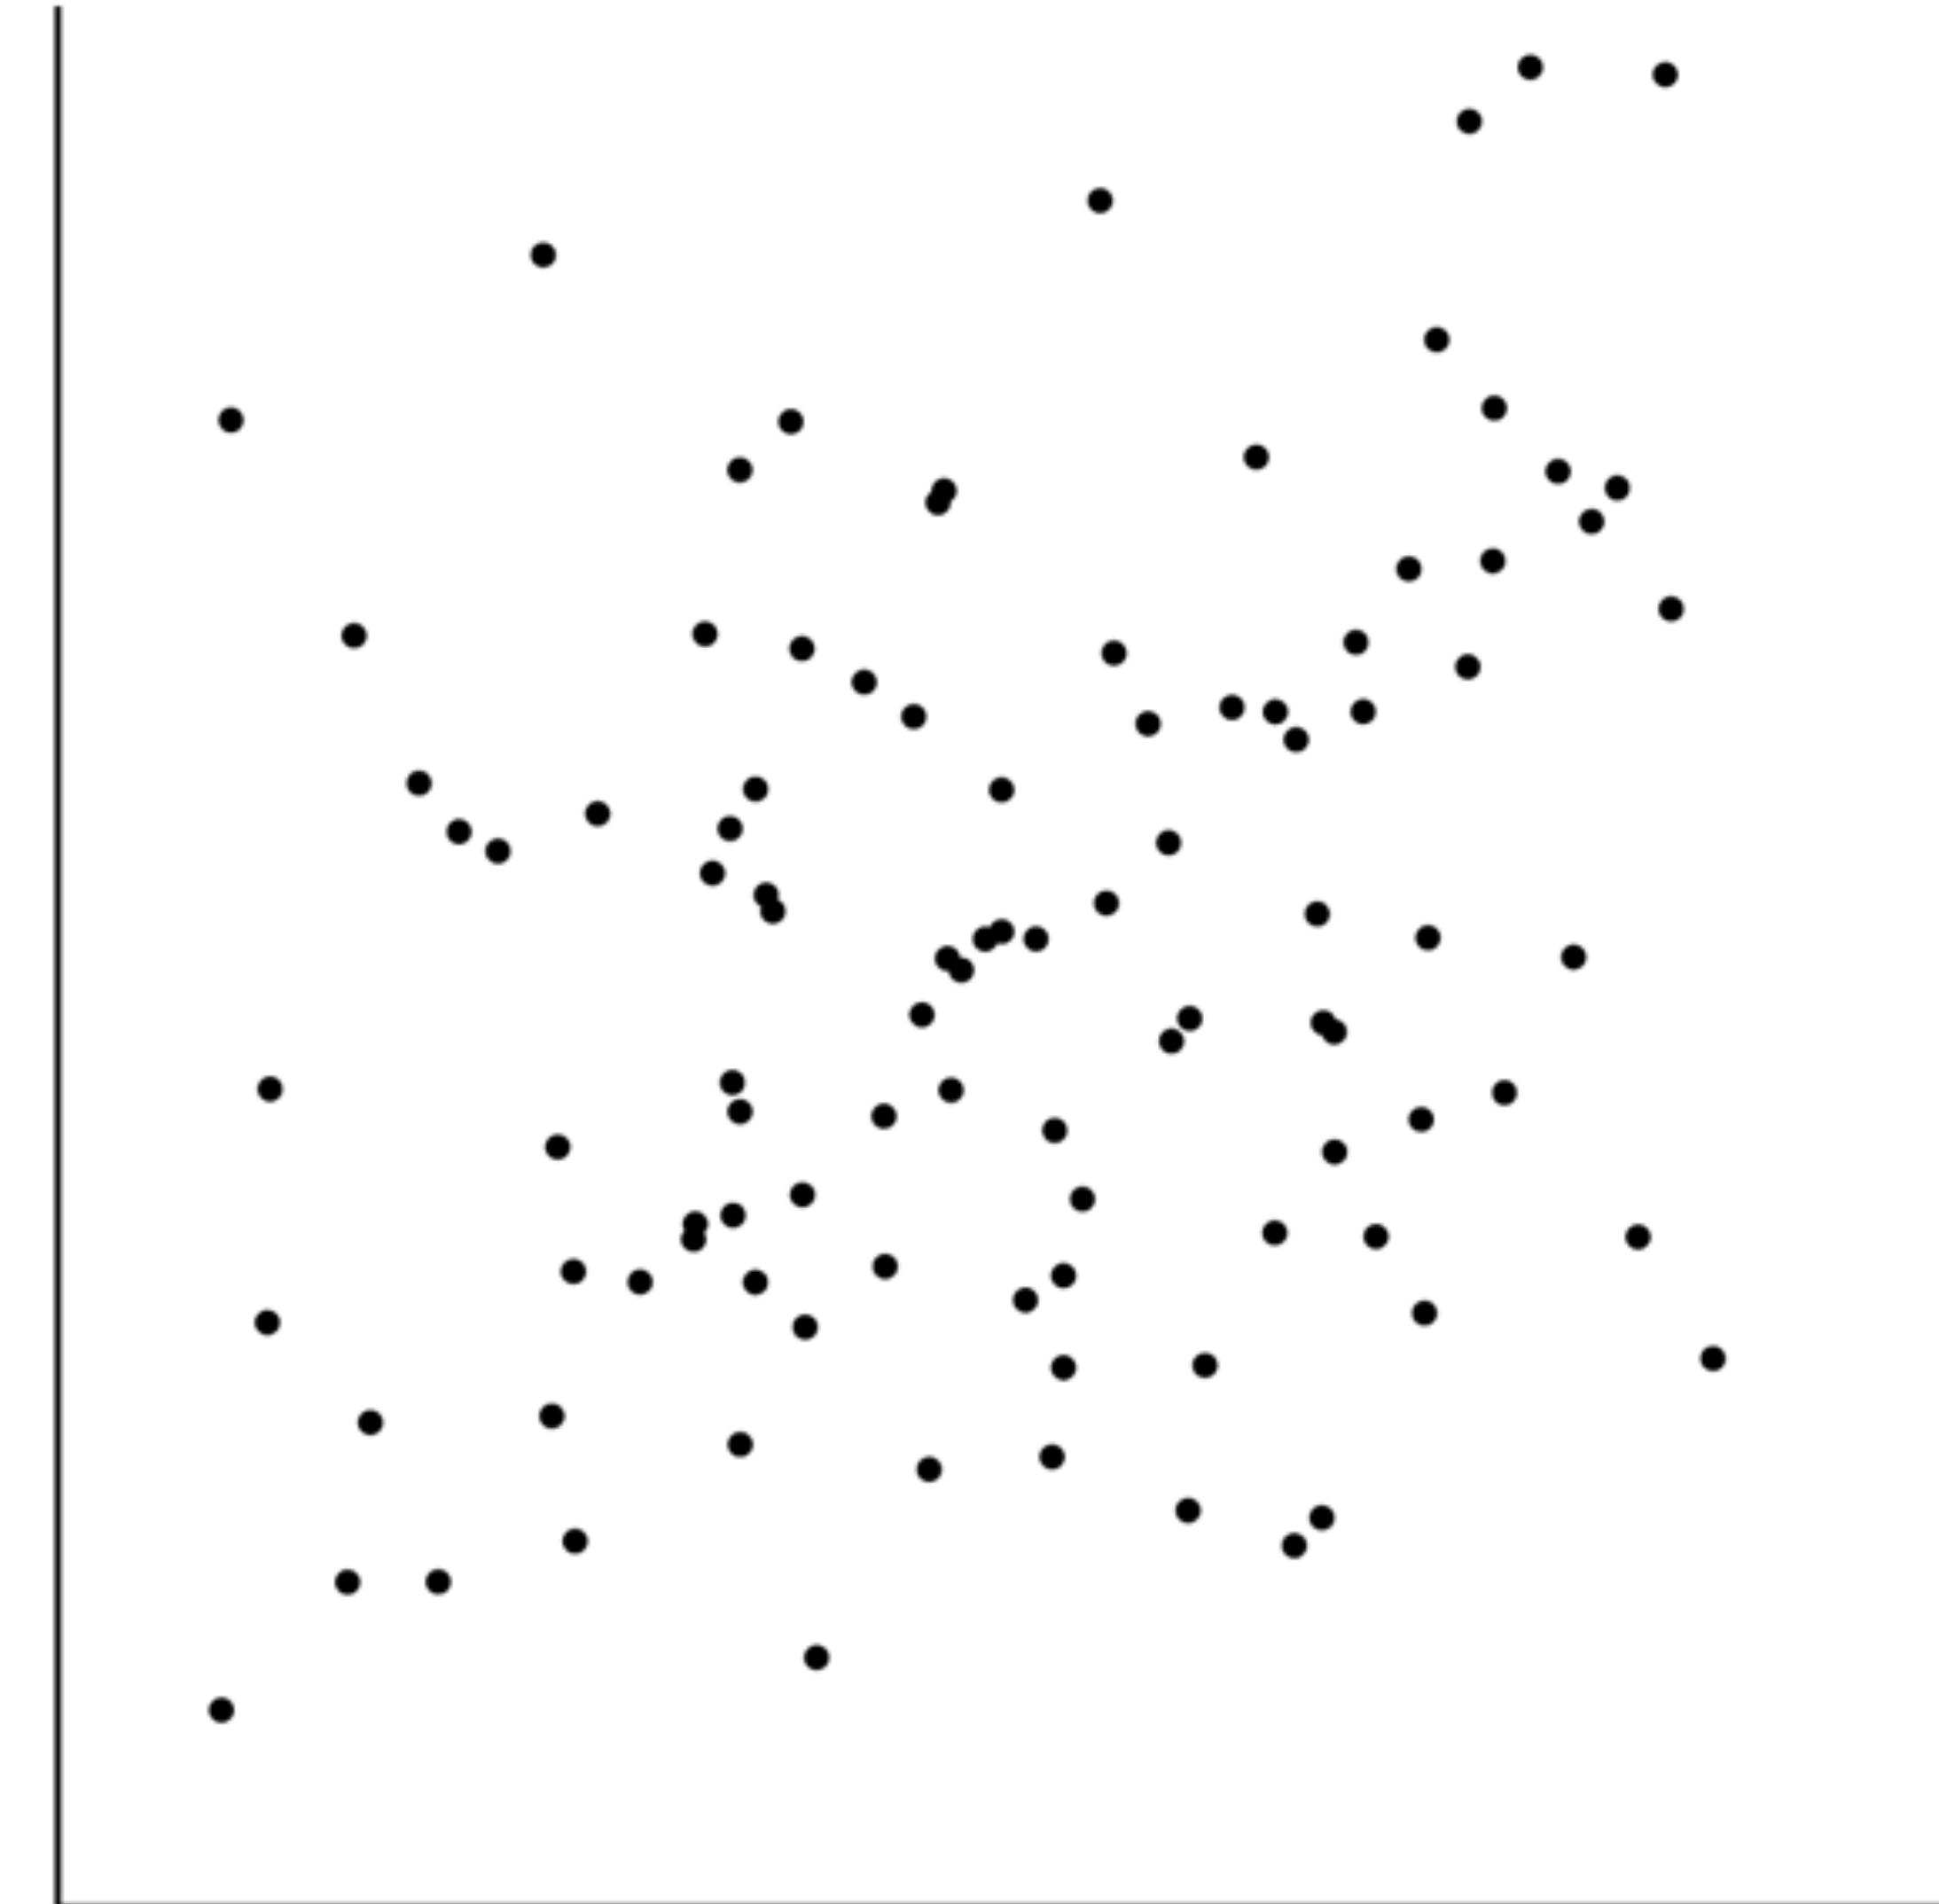

$r = 0.35$

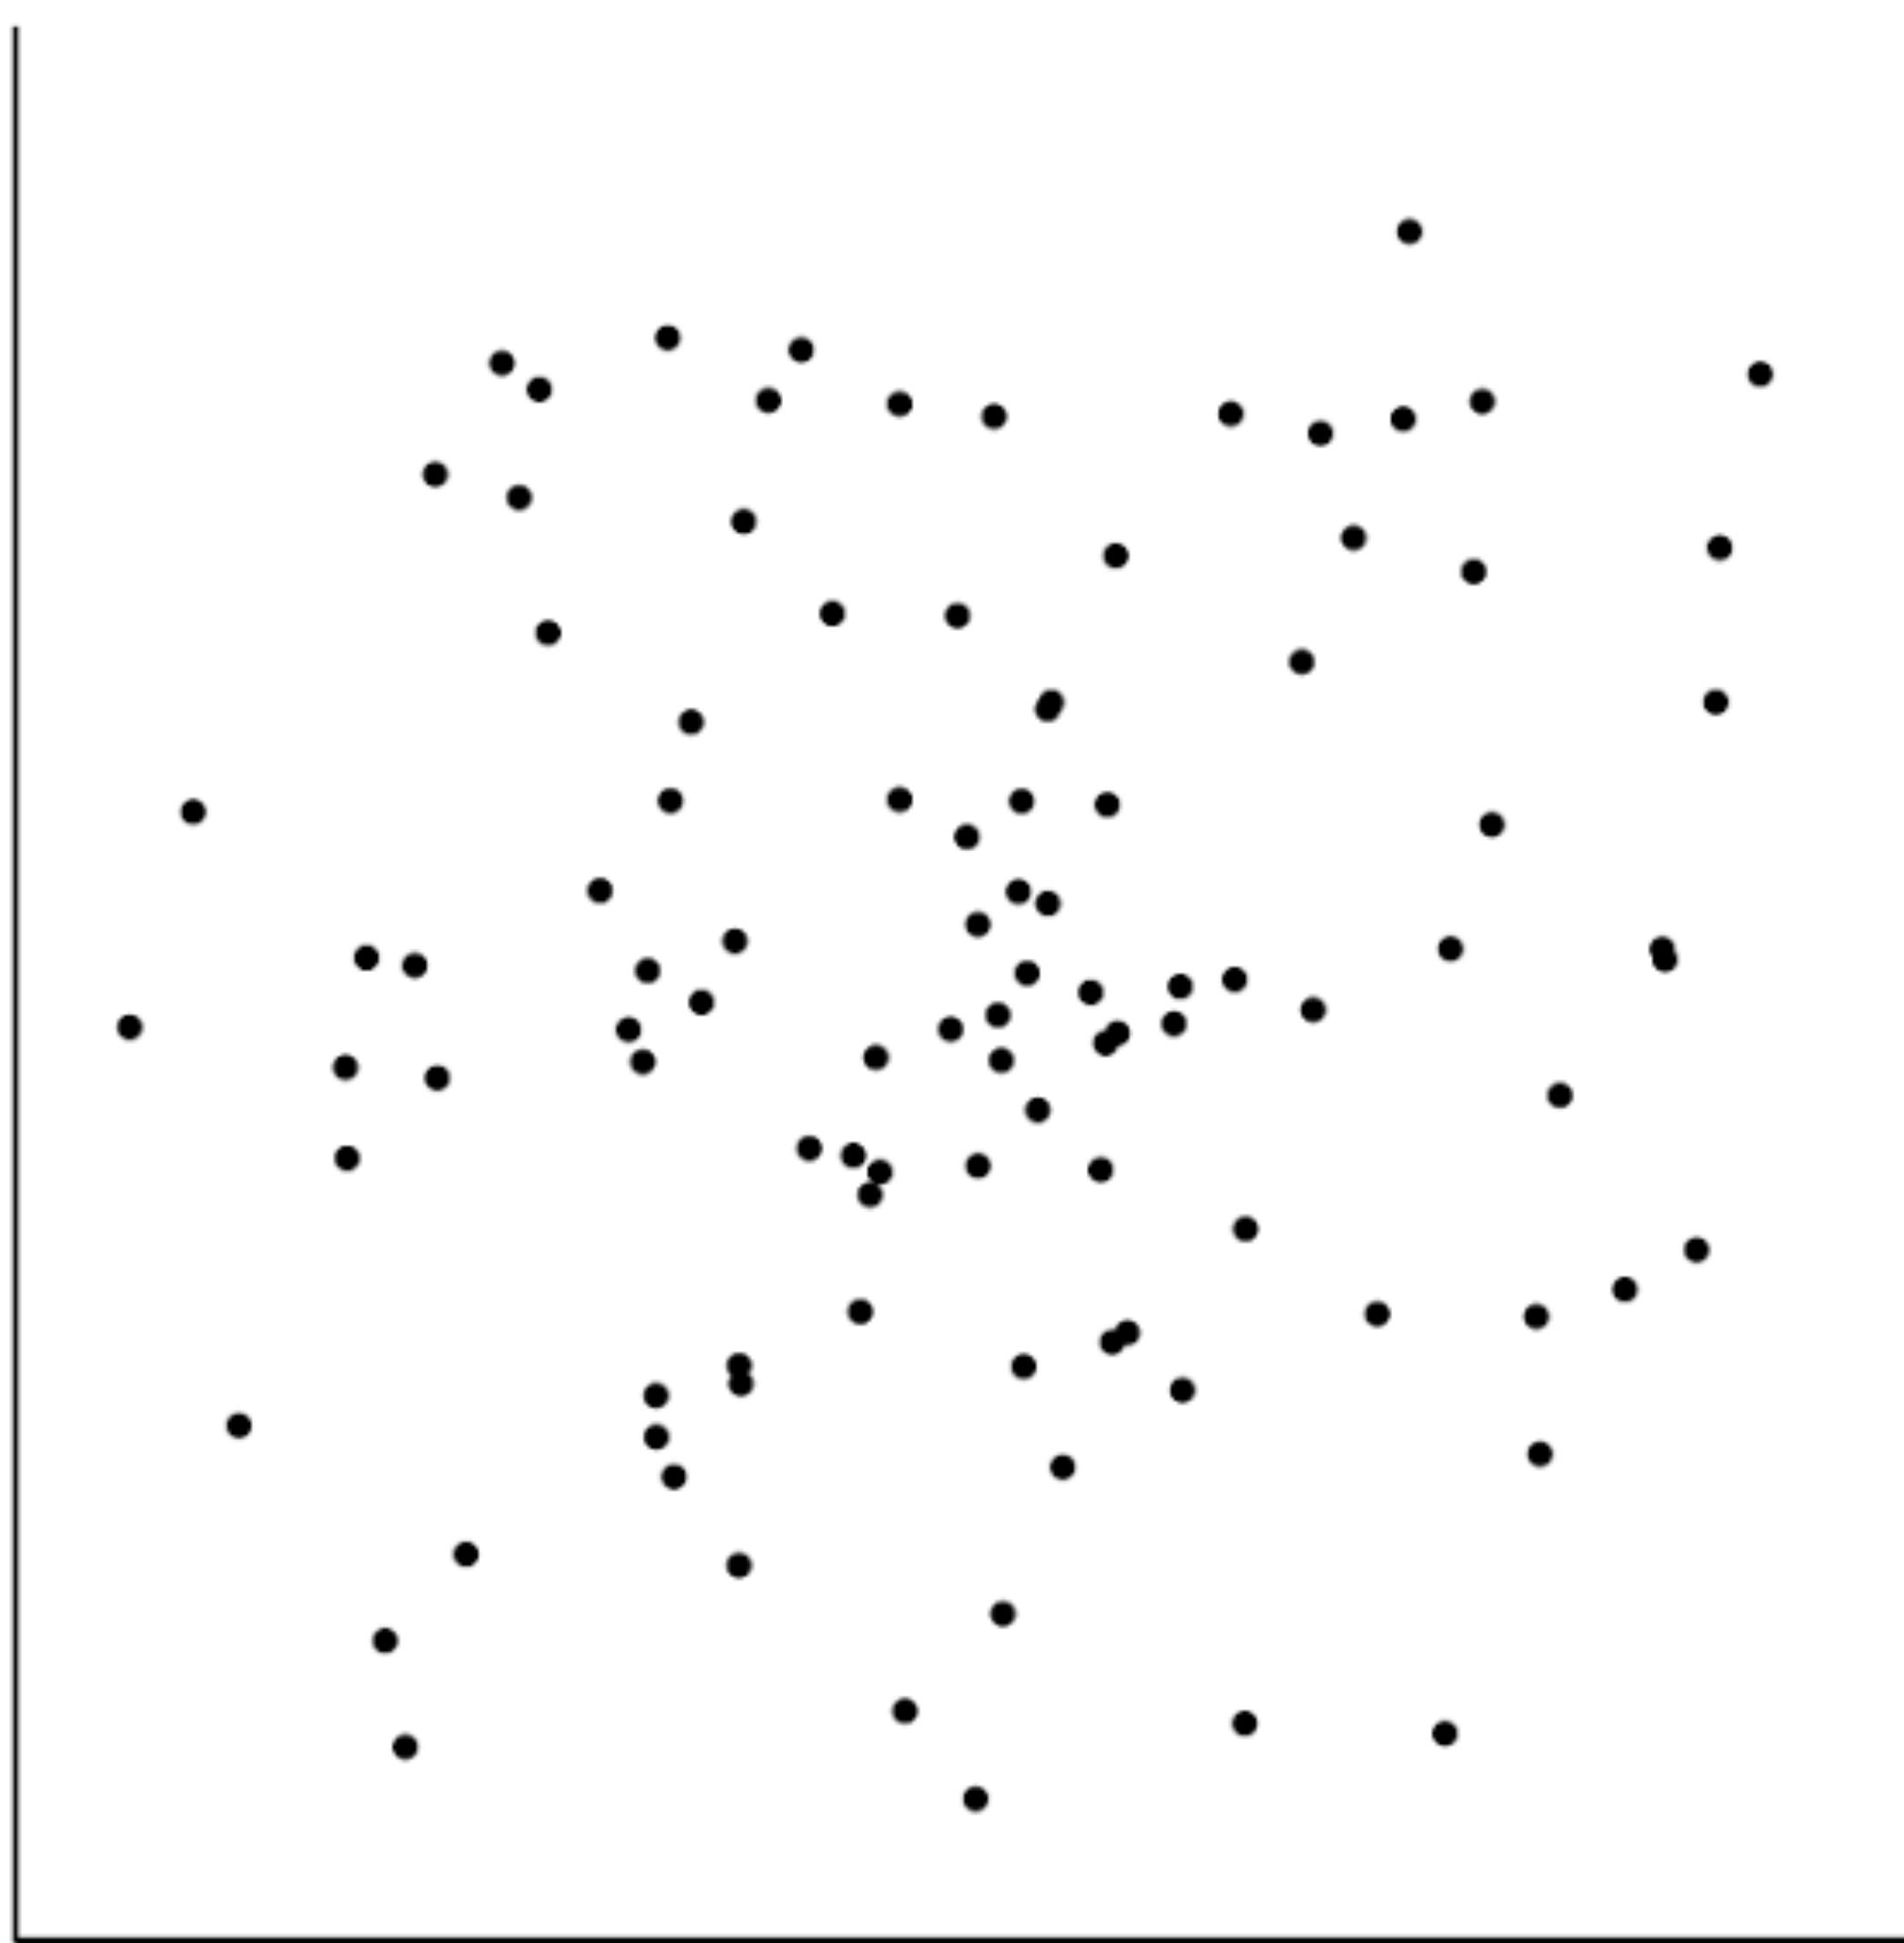

*To see a diff,
decrease to 0.1!*

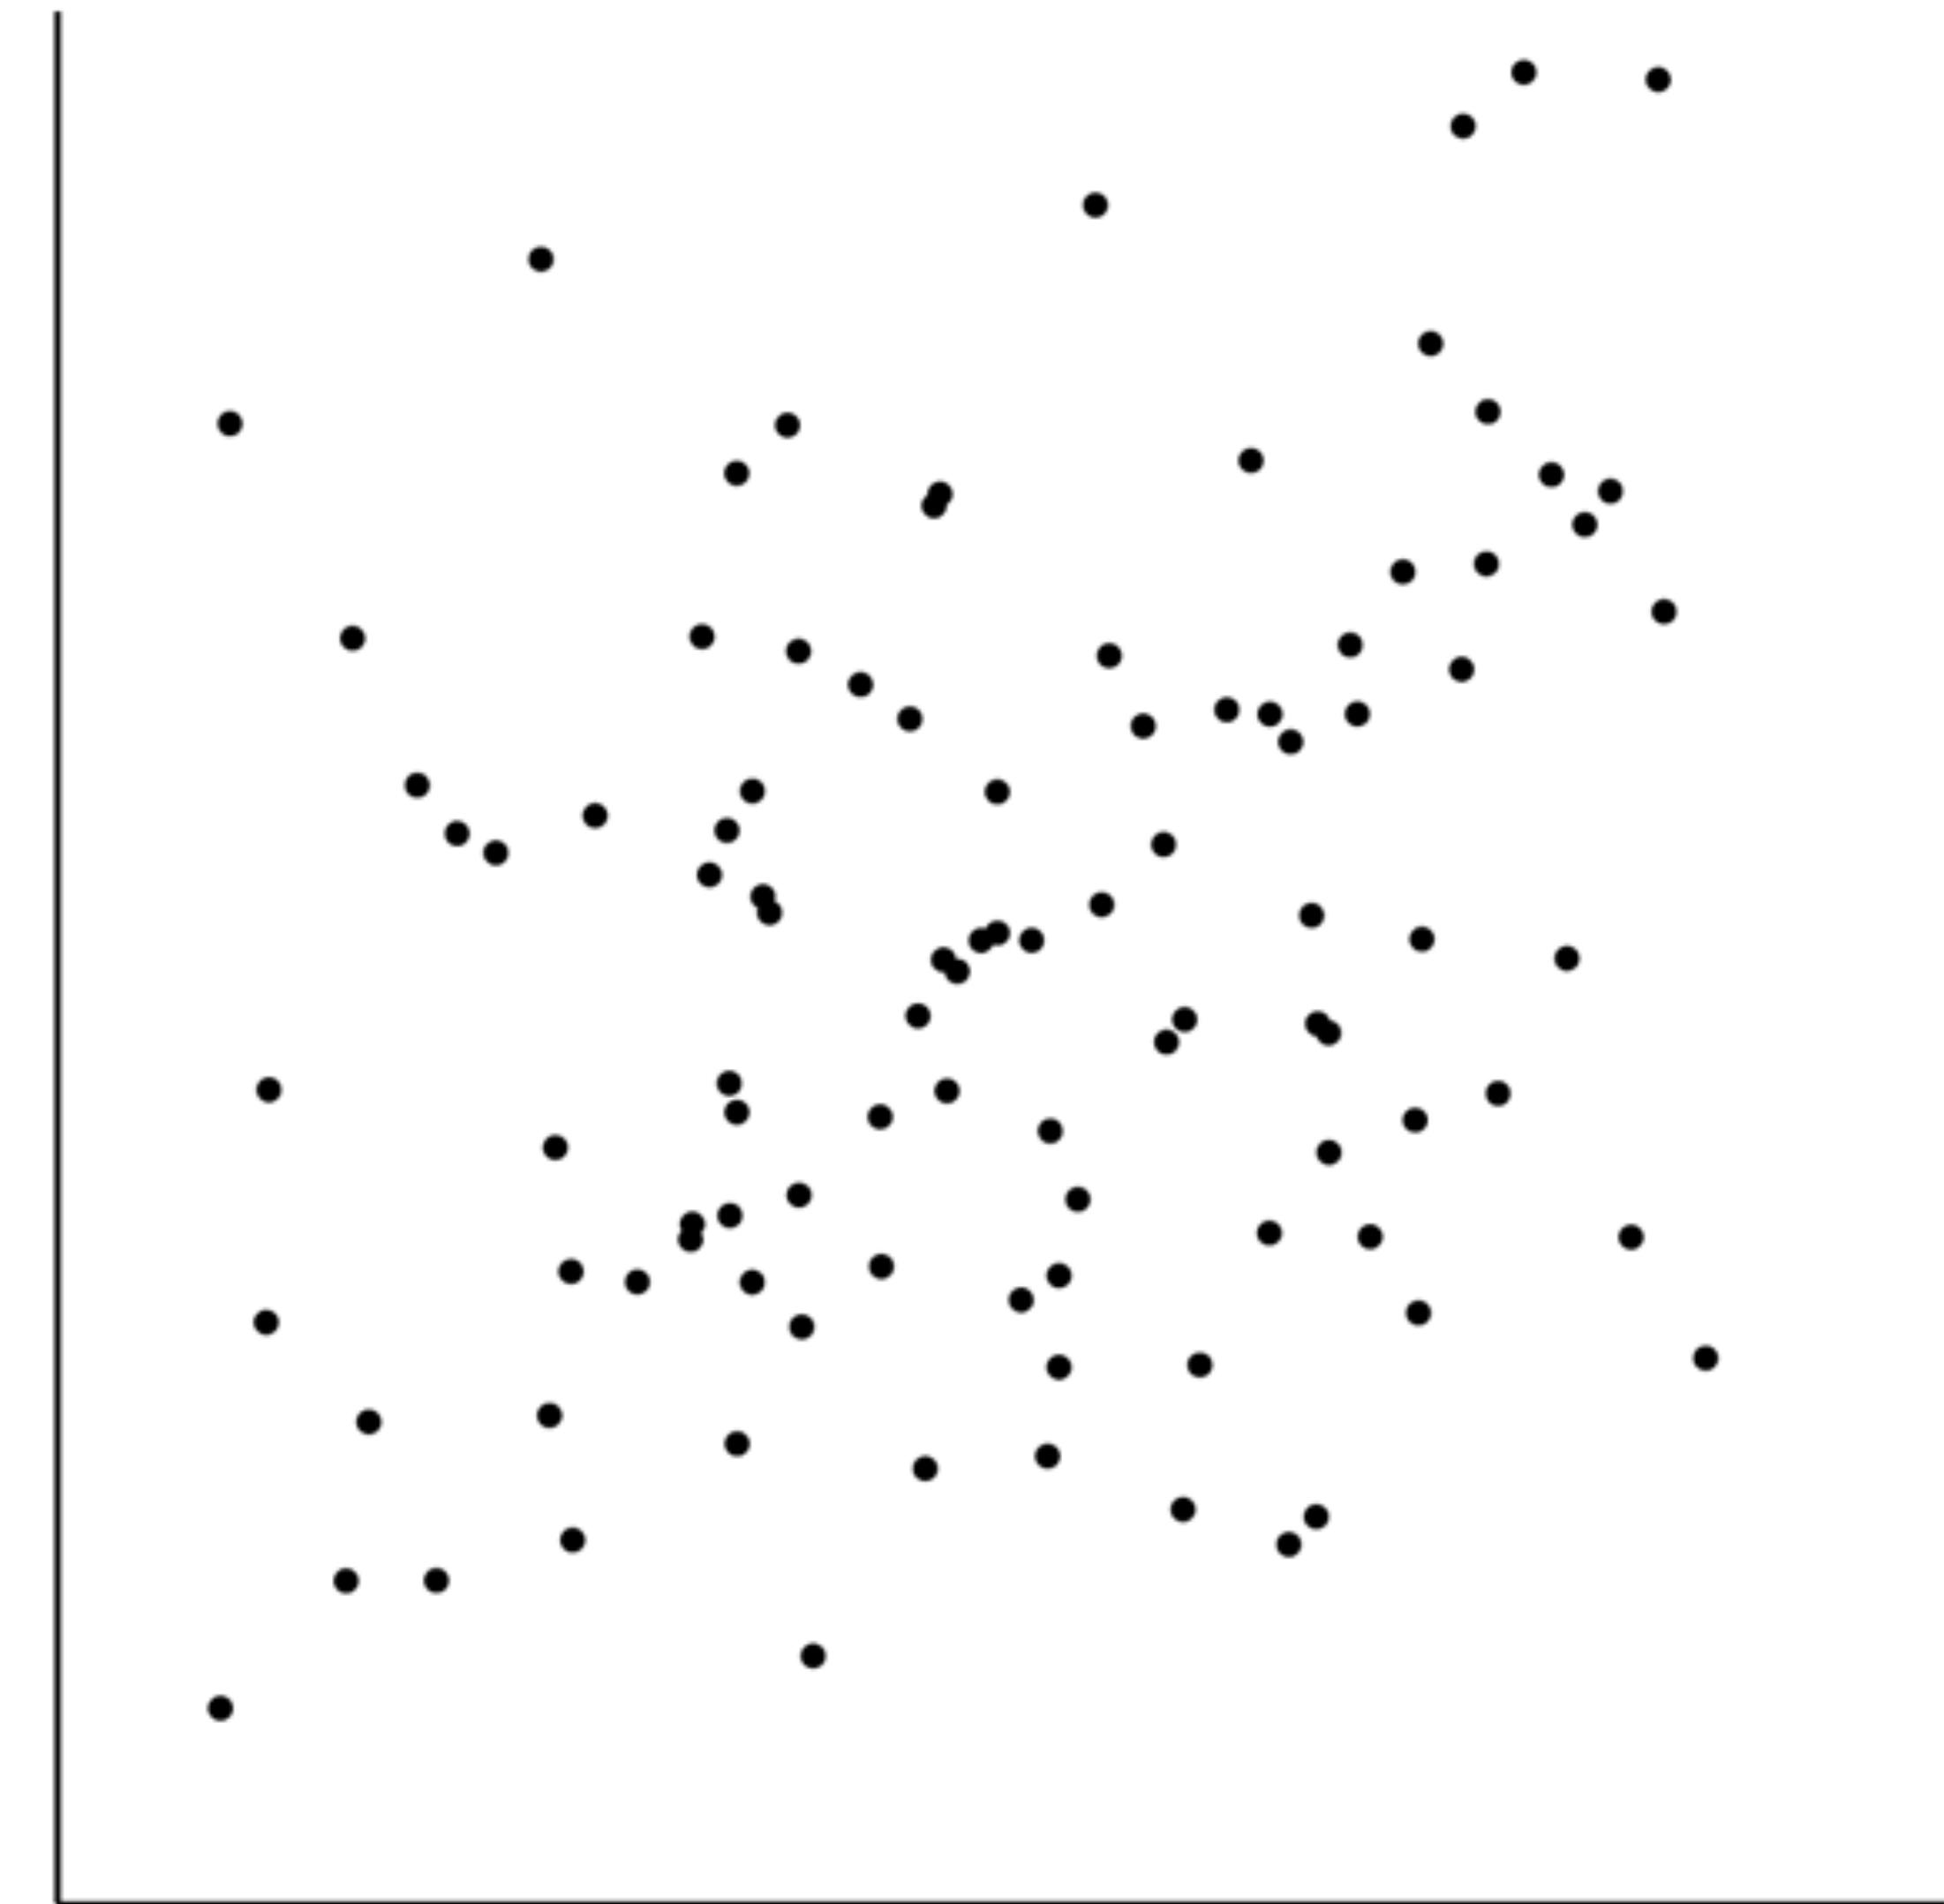

$r = 0.3$

$r = 0.1$

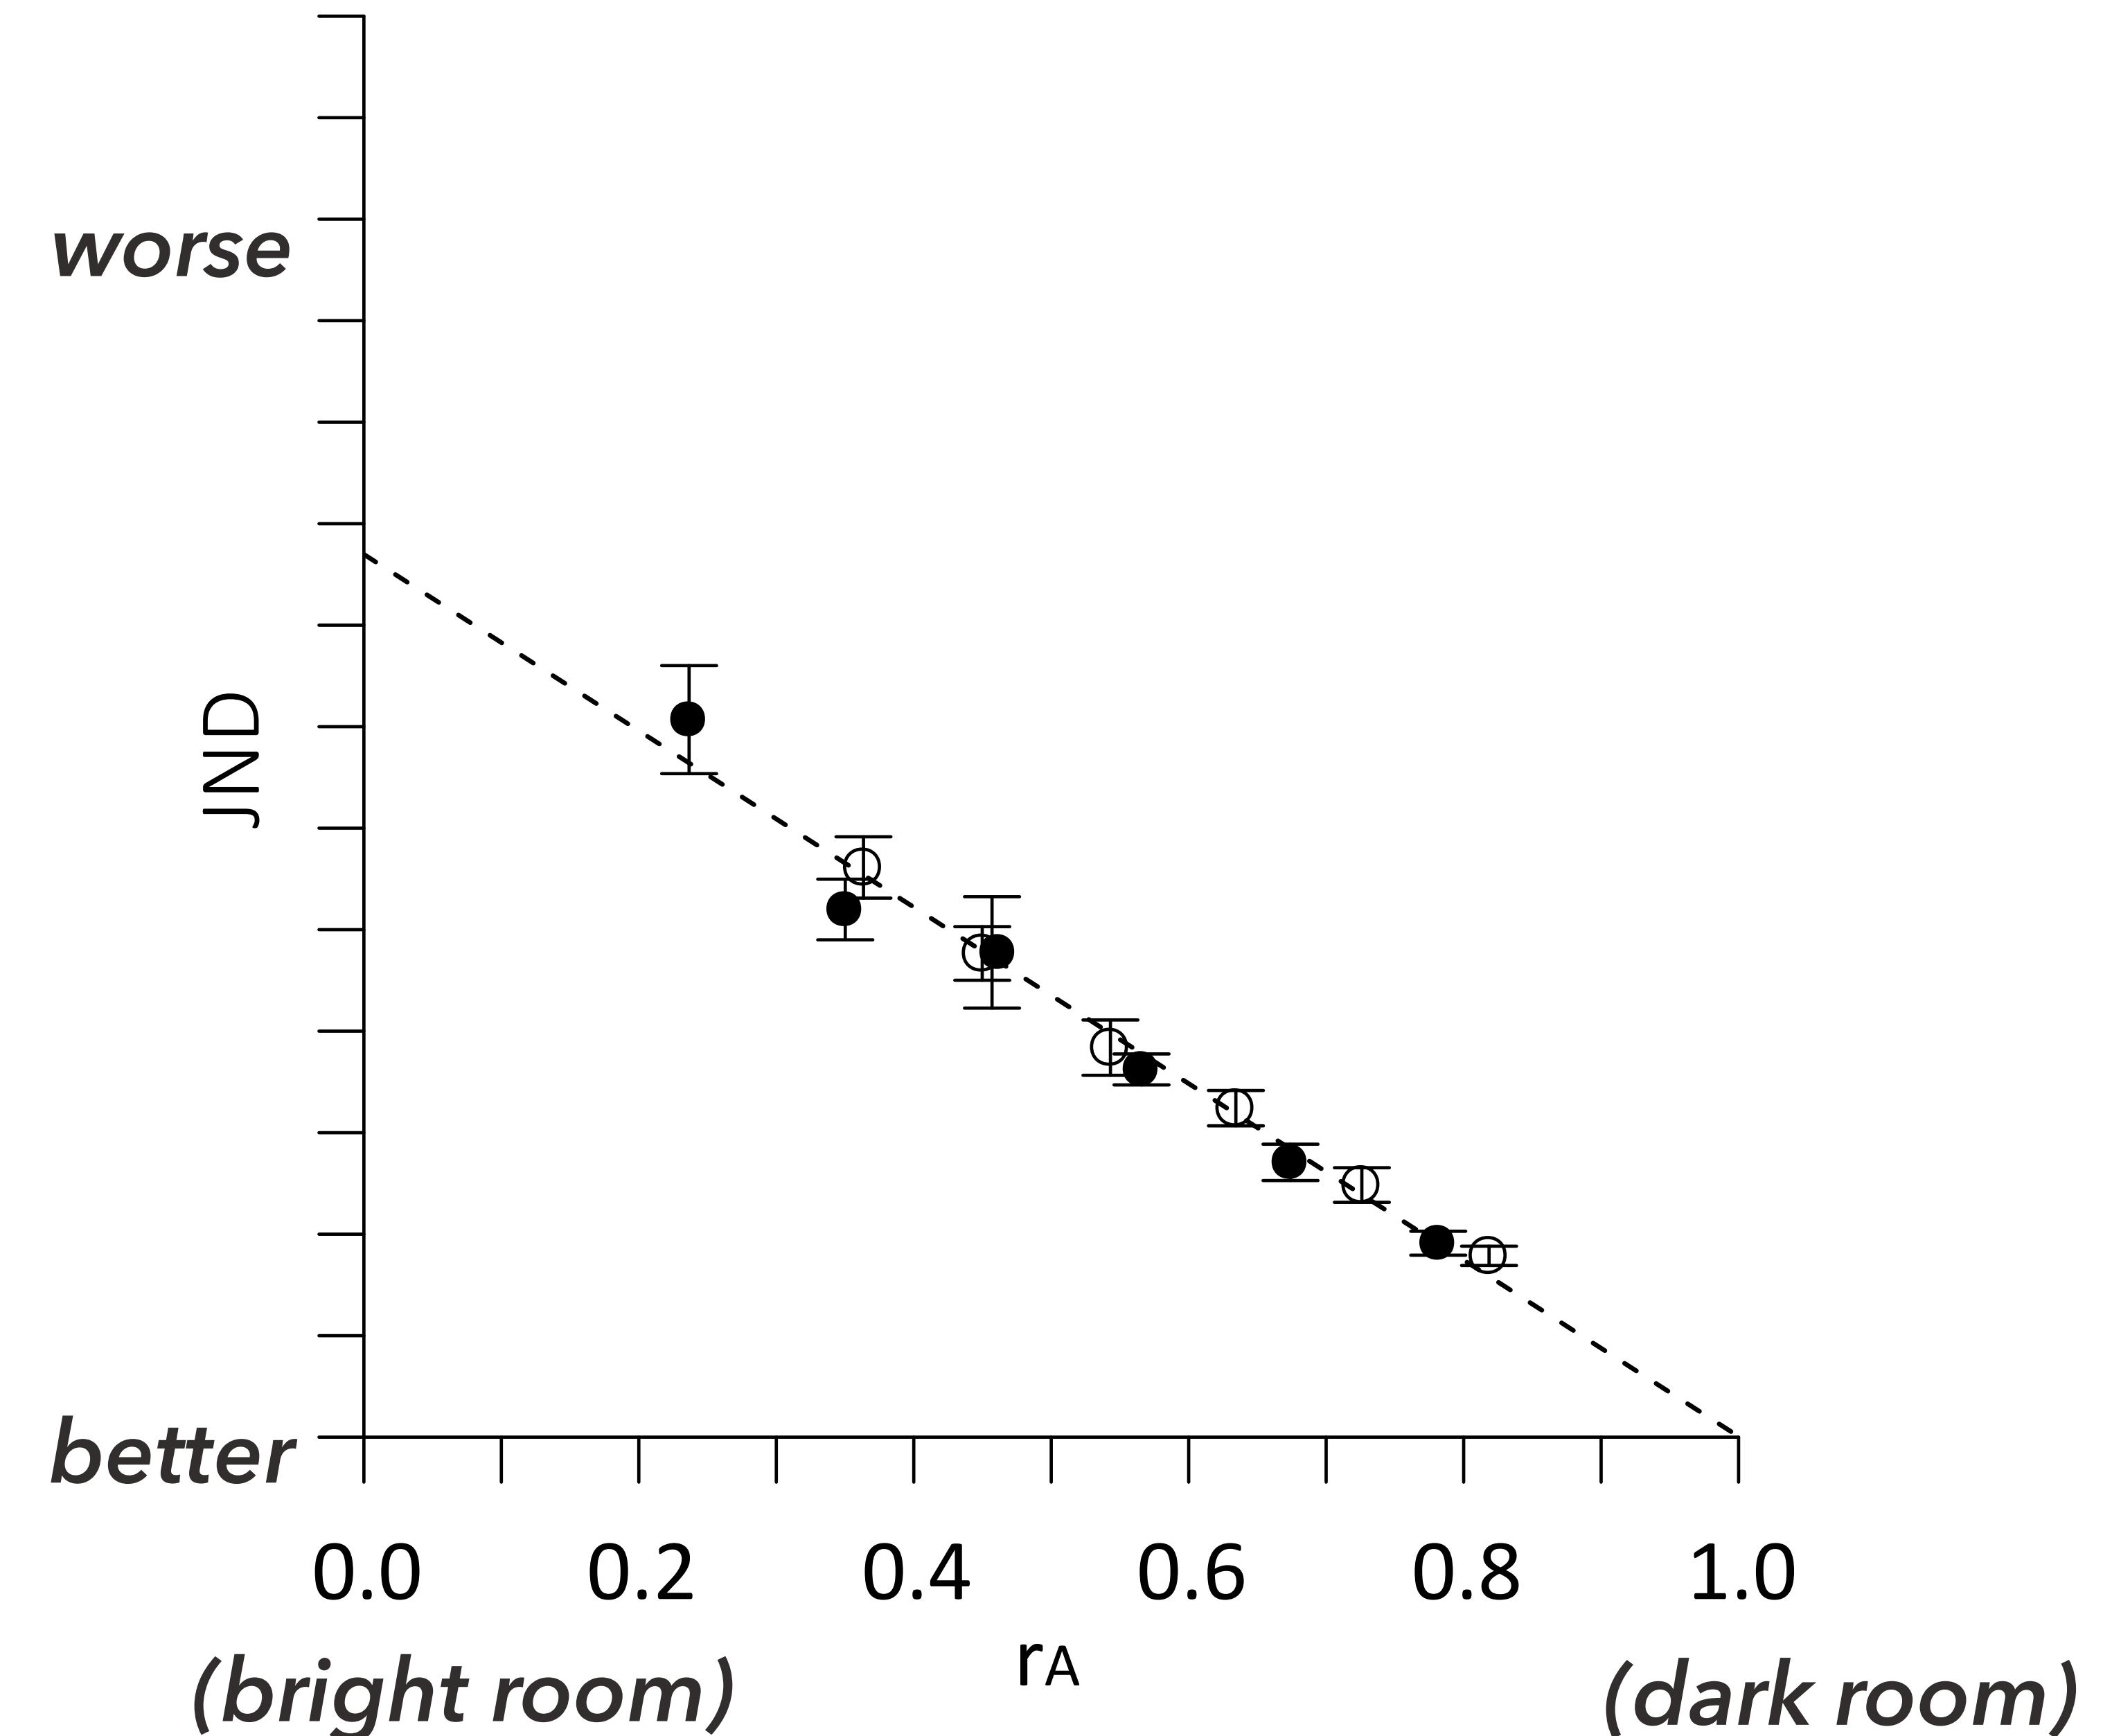

$r = 0.3$

Rensink's insight...

Because the trend of JND & correlation is linear...

"The perception of correlation in scatterplots can be modeled using Weber's Law."

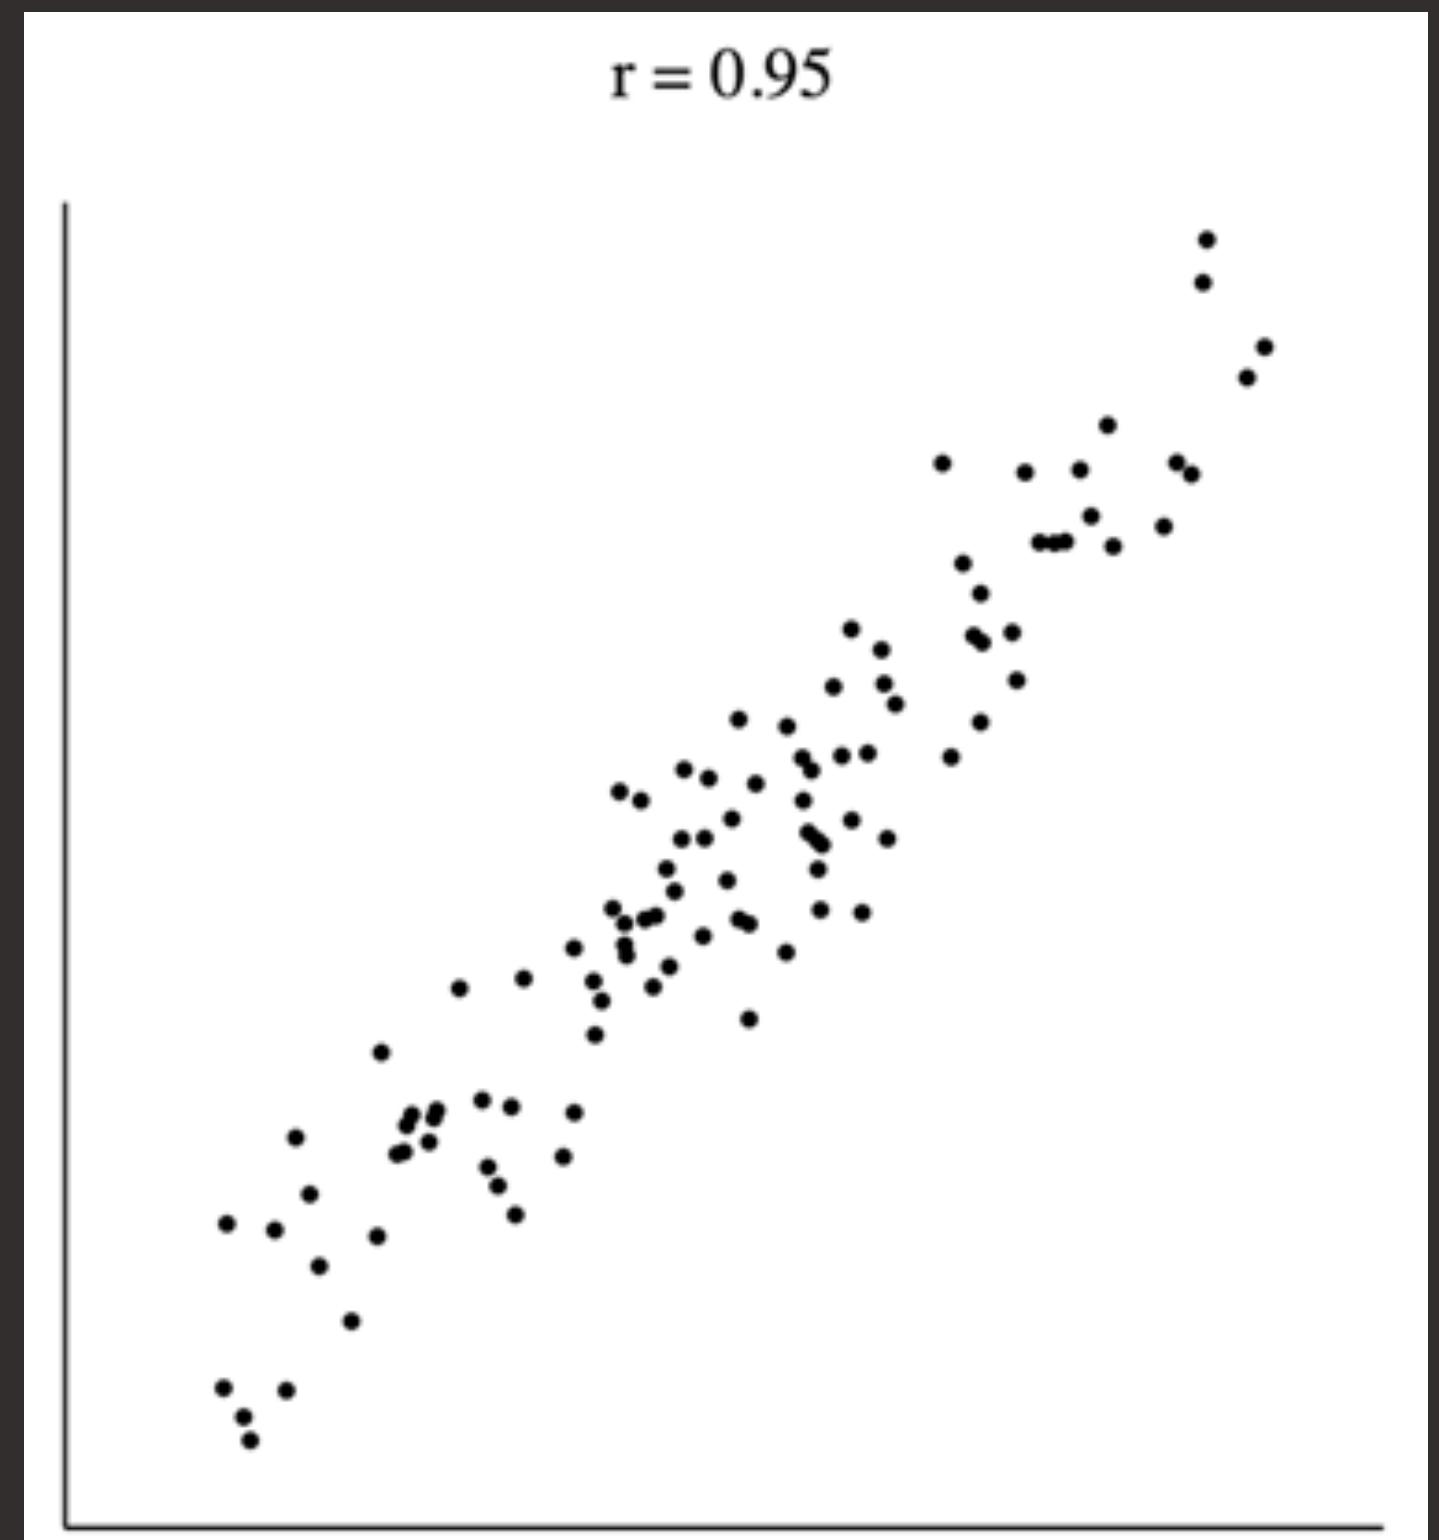

Weber's Law $\Delta P = k * \frac{\Delta I}{I}$

- *model for low-level perceptual discrimination*
- *sound, taste, weight, brightness, line-length*

Weber's Law $\Delta P = k * \frac{\Delta I}{I}$

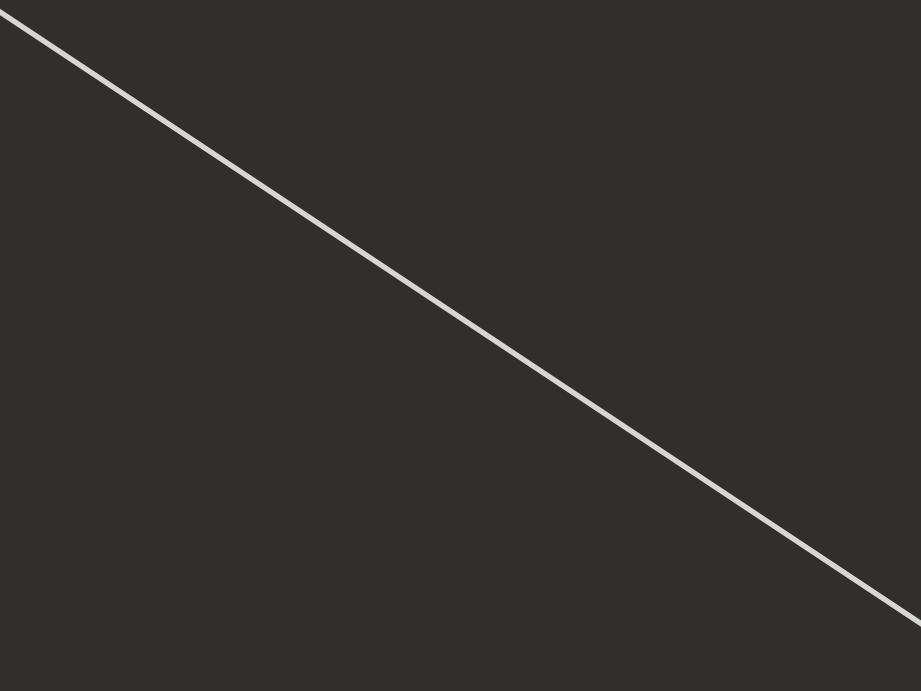

- *model for low-level perceptual discrimination*
- *sound, taste, weight, brightness, line-length*

$$\Delta P = k * \frac{\Delta I}{I}$$

Weber's Law

Perceived diff

$$\Delta P = k * \frac{\Delta I}{I}$$

Perceived diff

$$\Delta P = k * \frac{\Delta I}{I}$$

Actual intensity of Stimulus

Perceived diff

Change in Intensity

$$\Delta P = k * \frac{\Delta I}{I}$$

Actual intensity of Stimulus

Perceived diff

Change in Intensity

$$\Delta P = k * \frac{\Delta I}{I}$$

via experiment

Actual intensity of Stimulus

bright room, high intensity

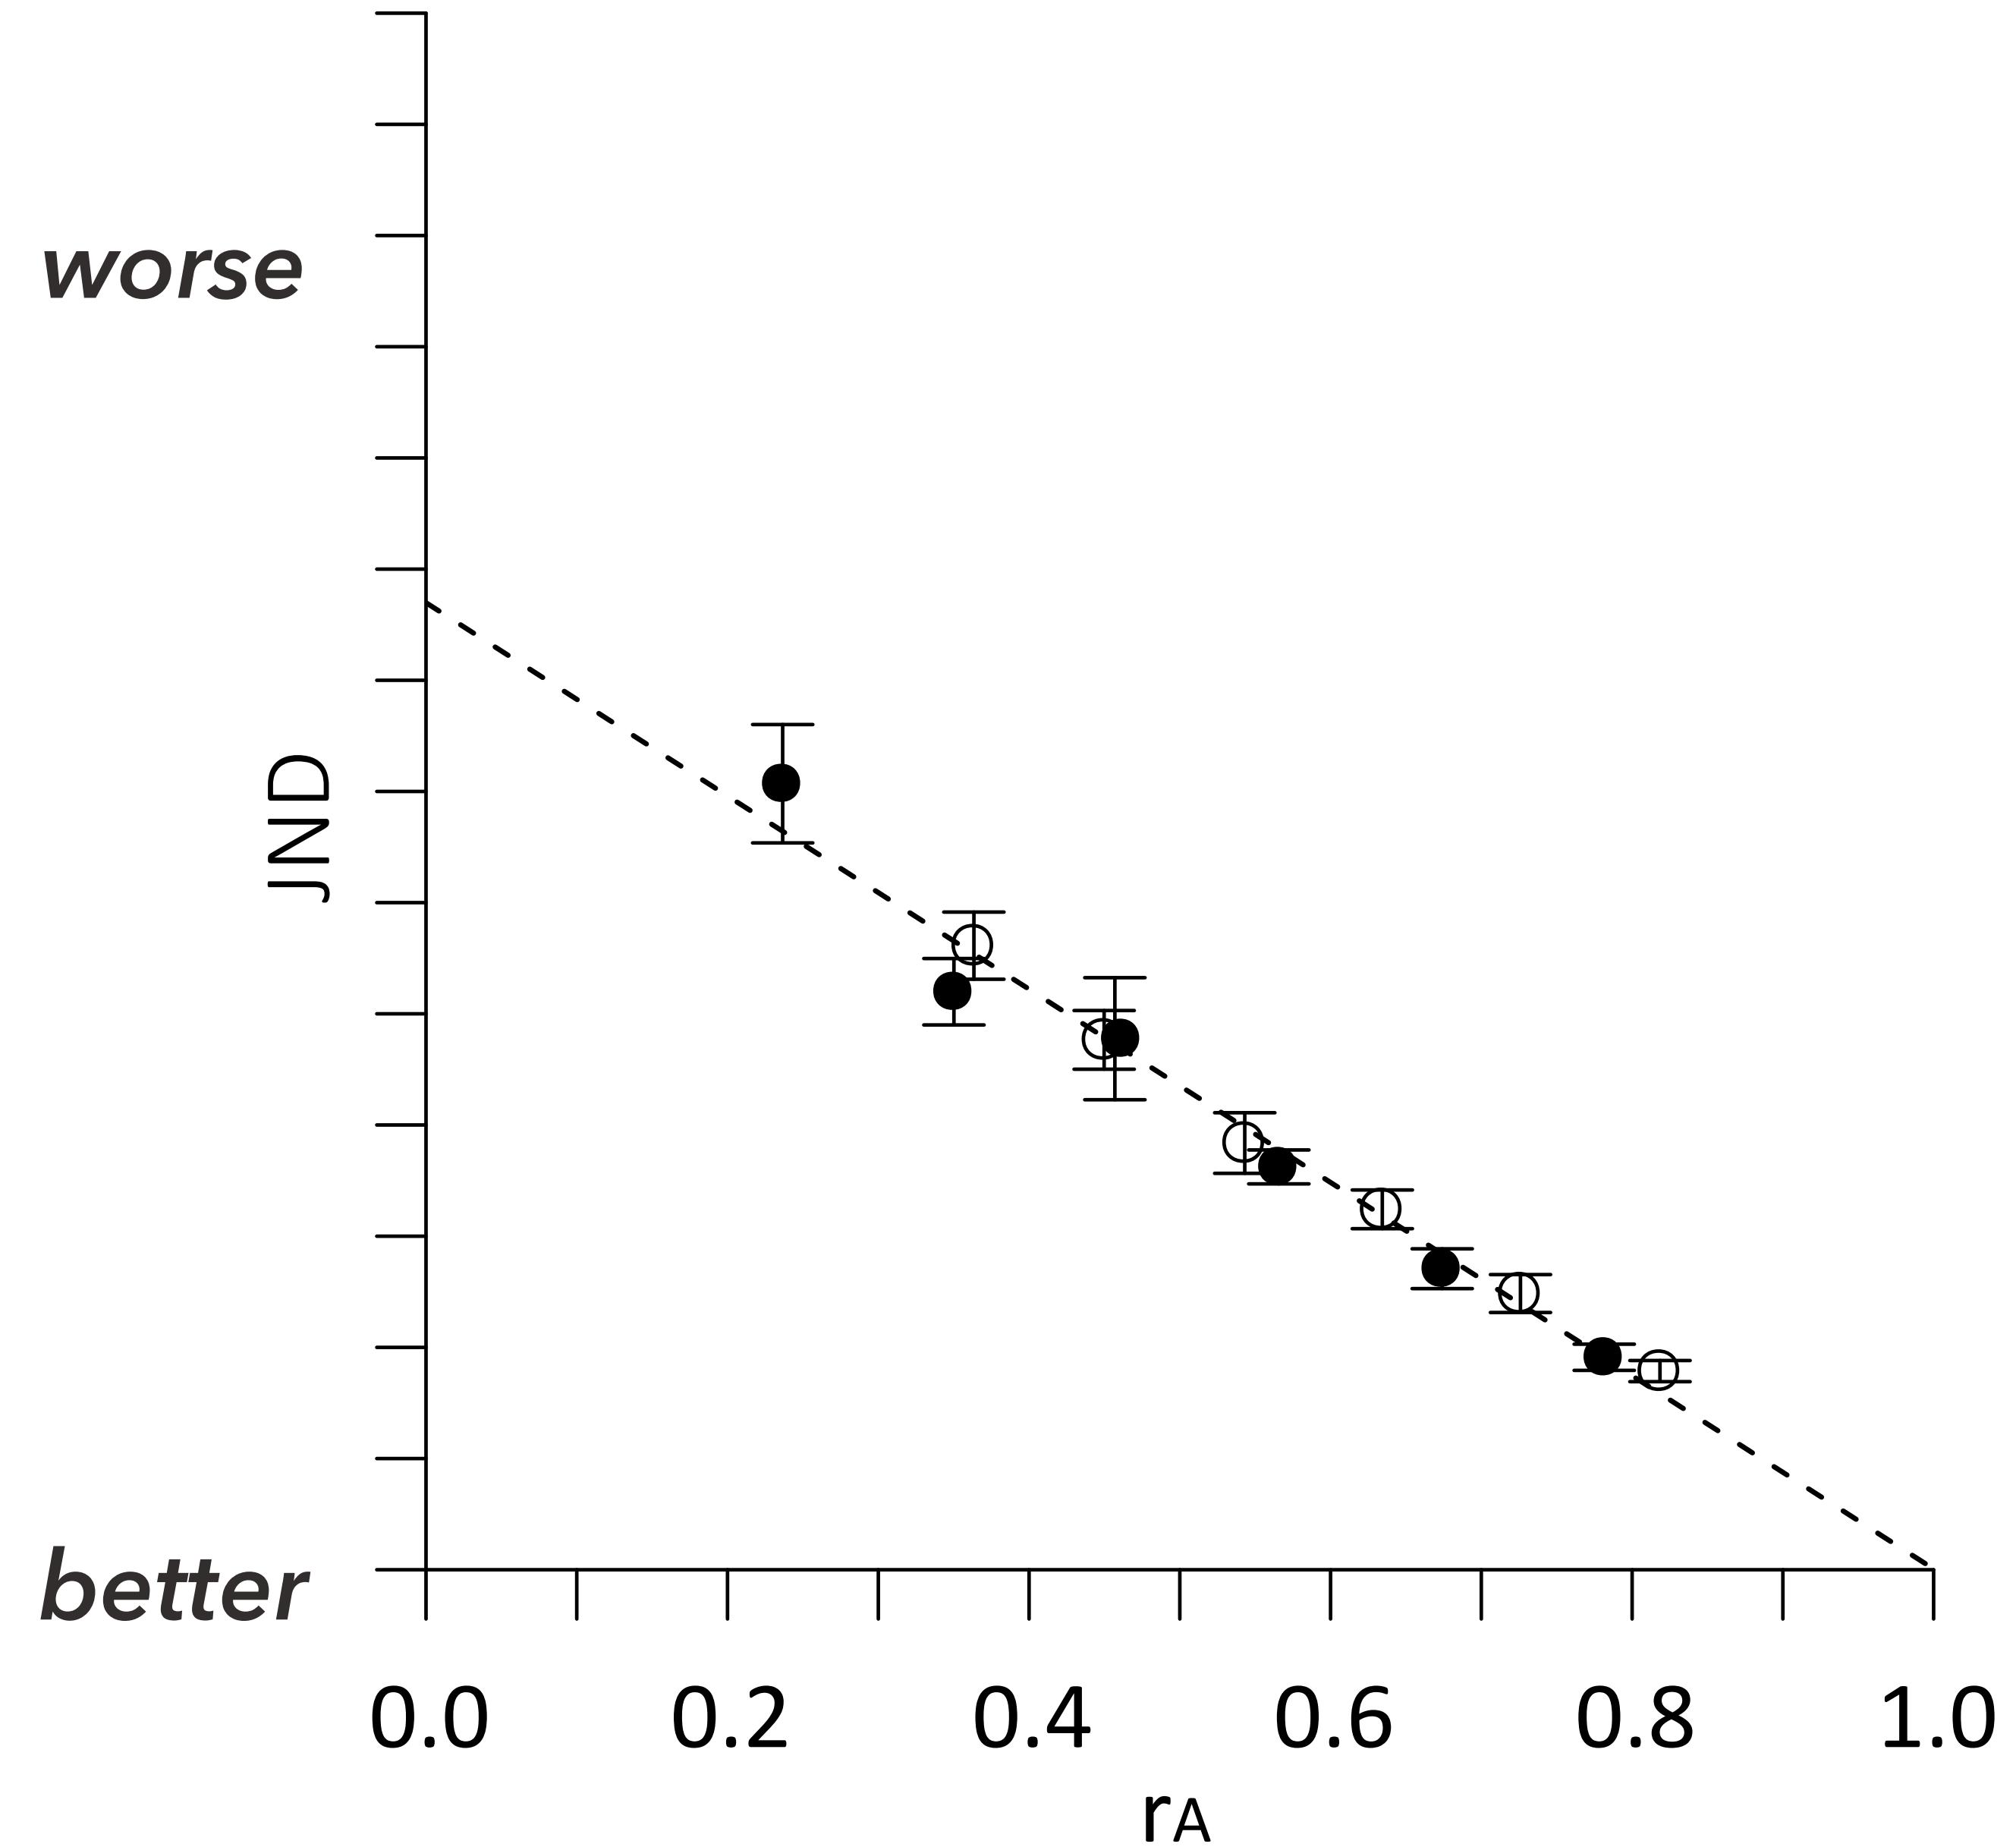

$$\Delta P = k * \frac{\Delta I}{I}$$

super bright light needed

$$\Delta P = k * \frac{\Delta I}{I}$$

Our hypothesis...

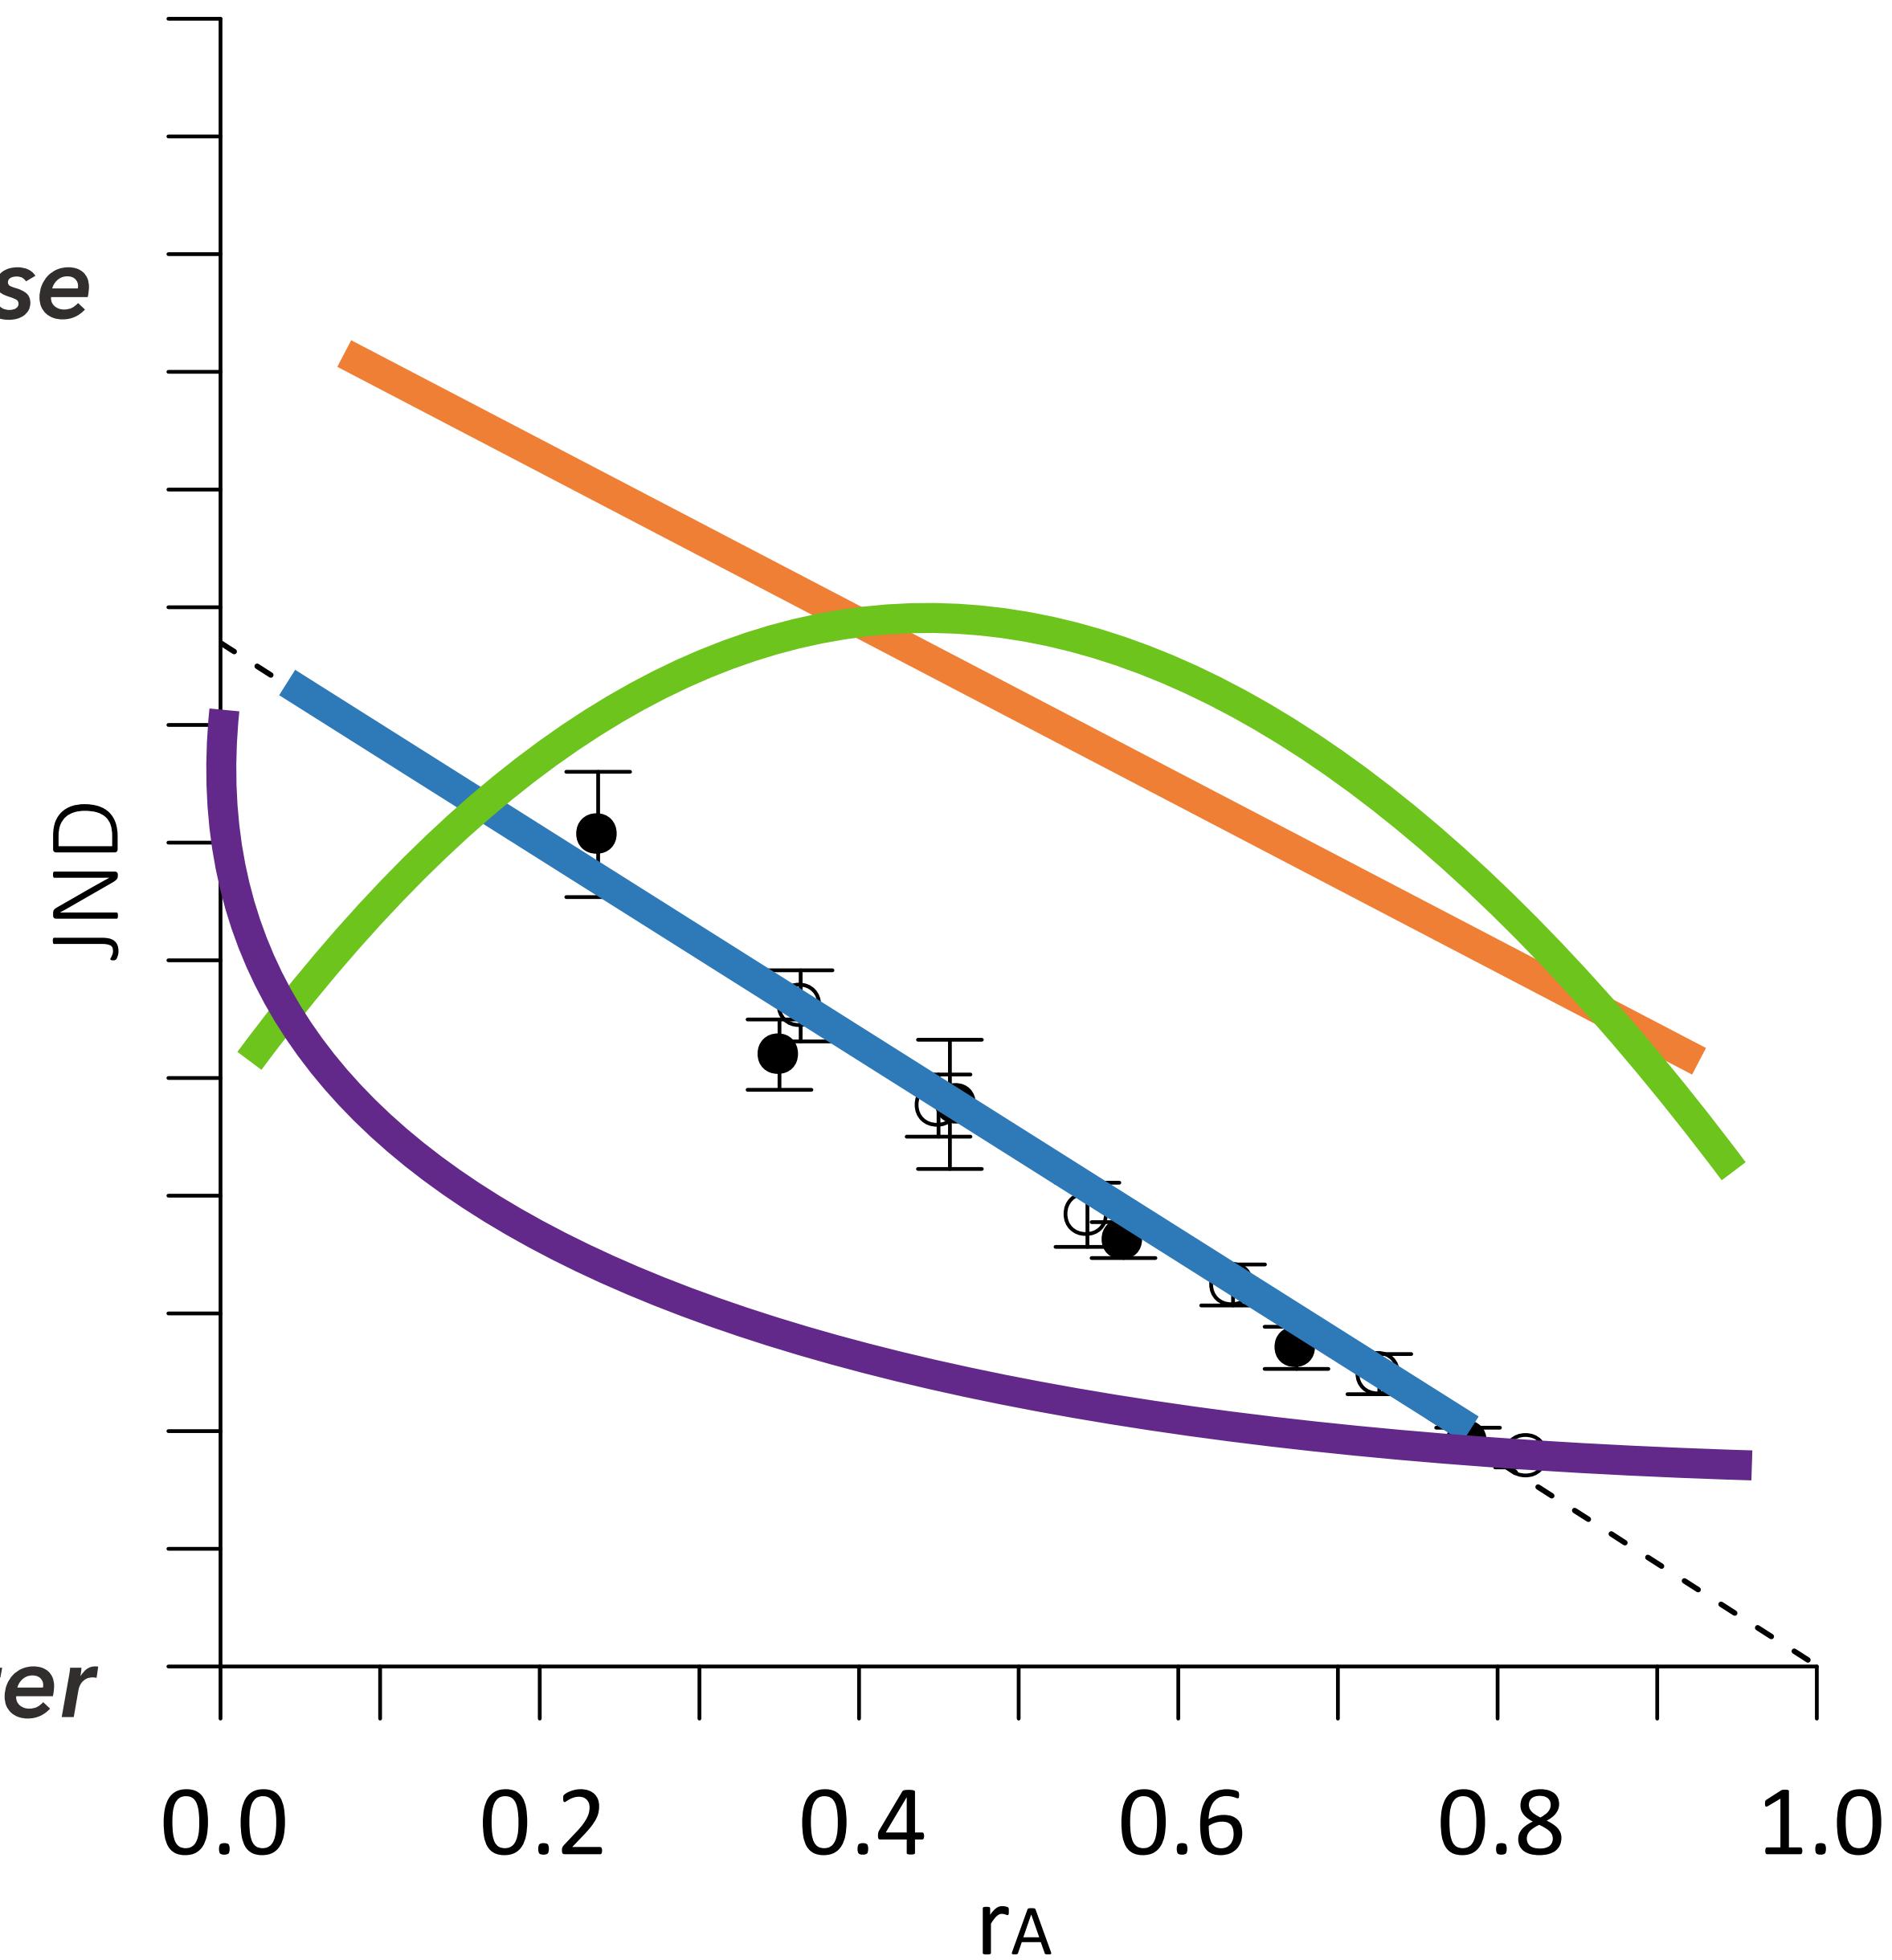

If the perception of correlation in scatterplots follows Weber's law...

*What does the
perception of
correlation in other
charts look like?*

worse

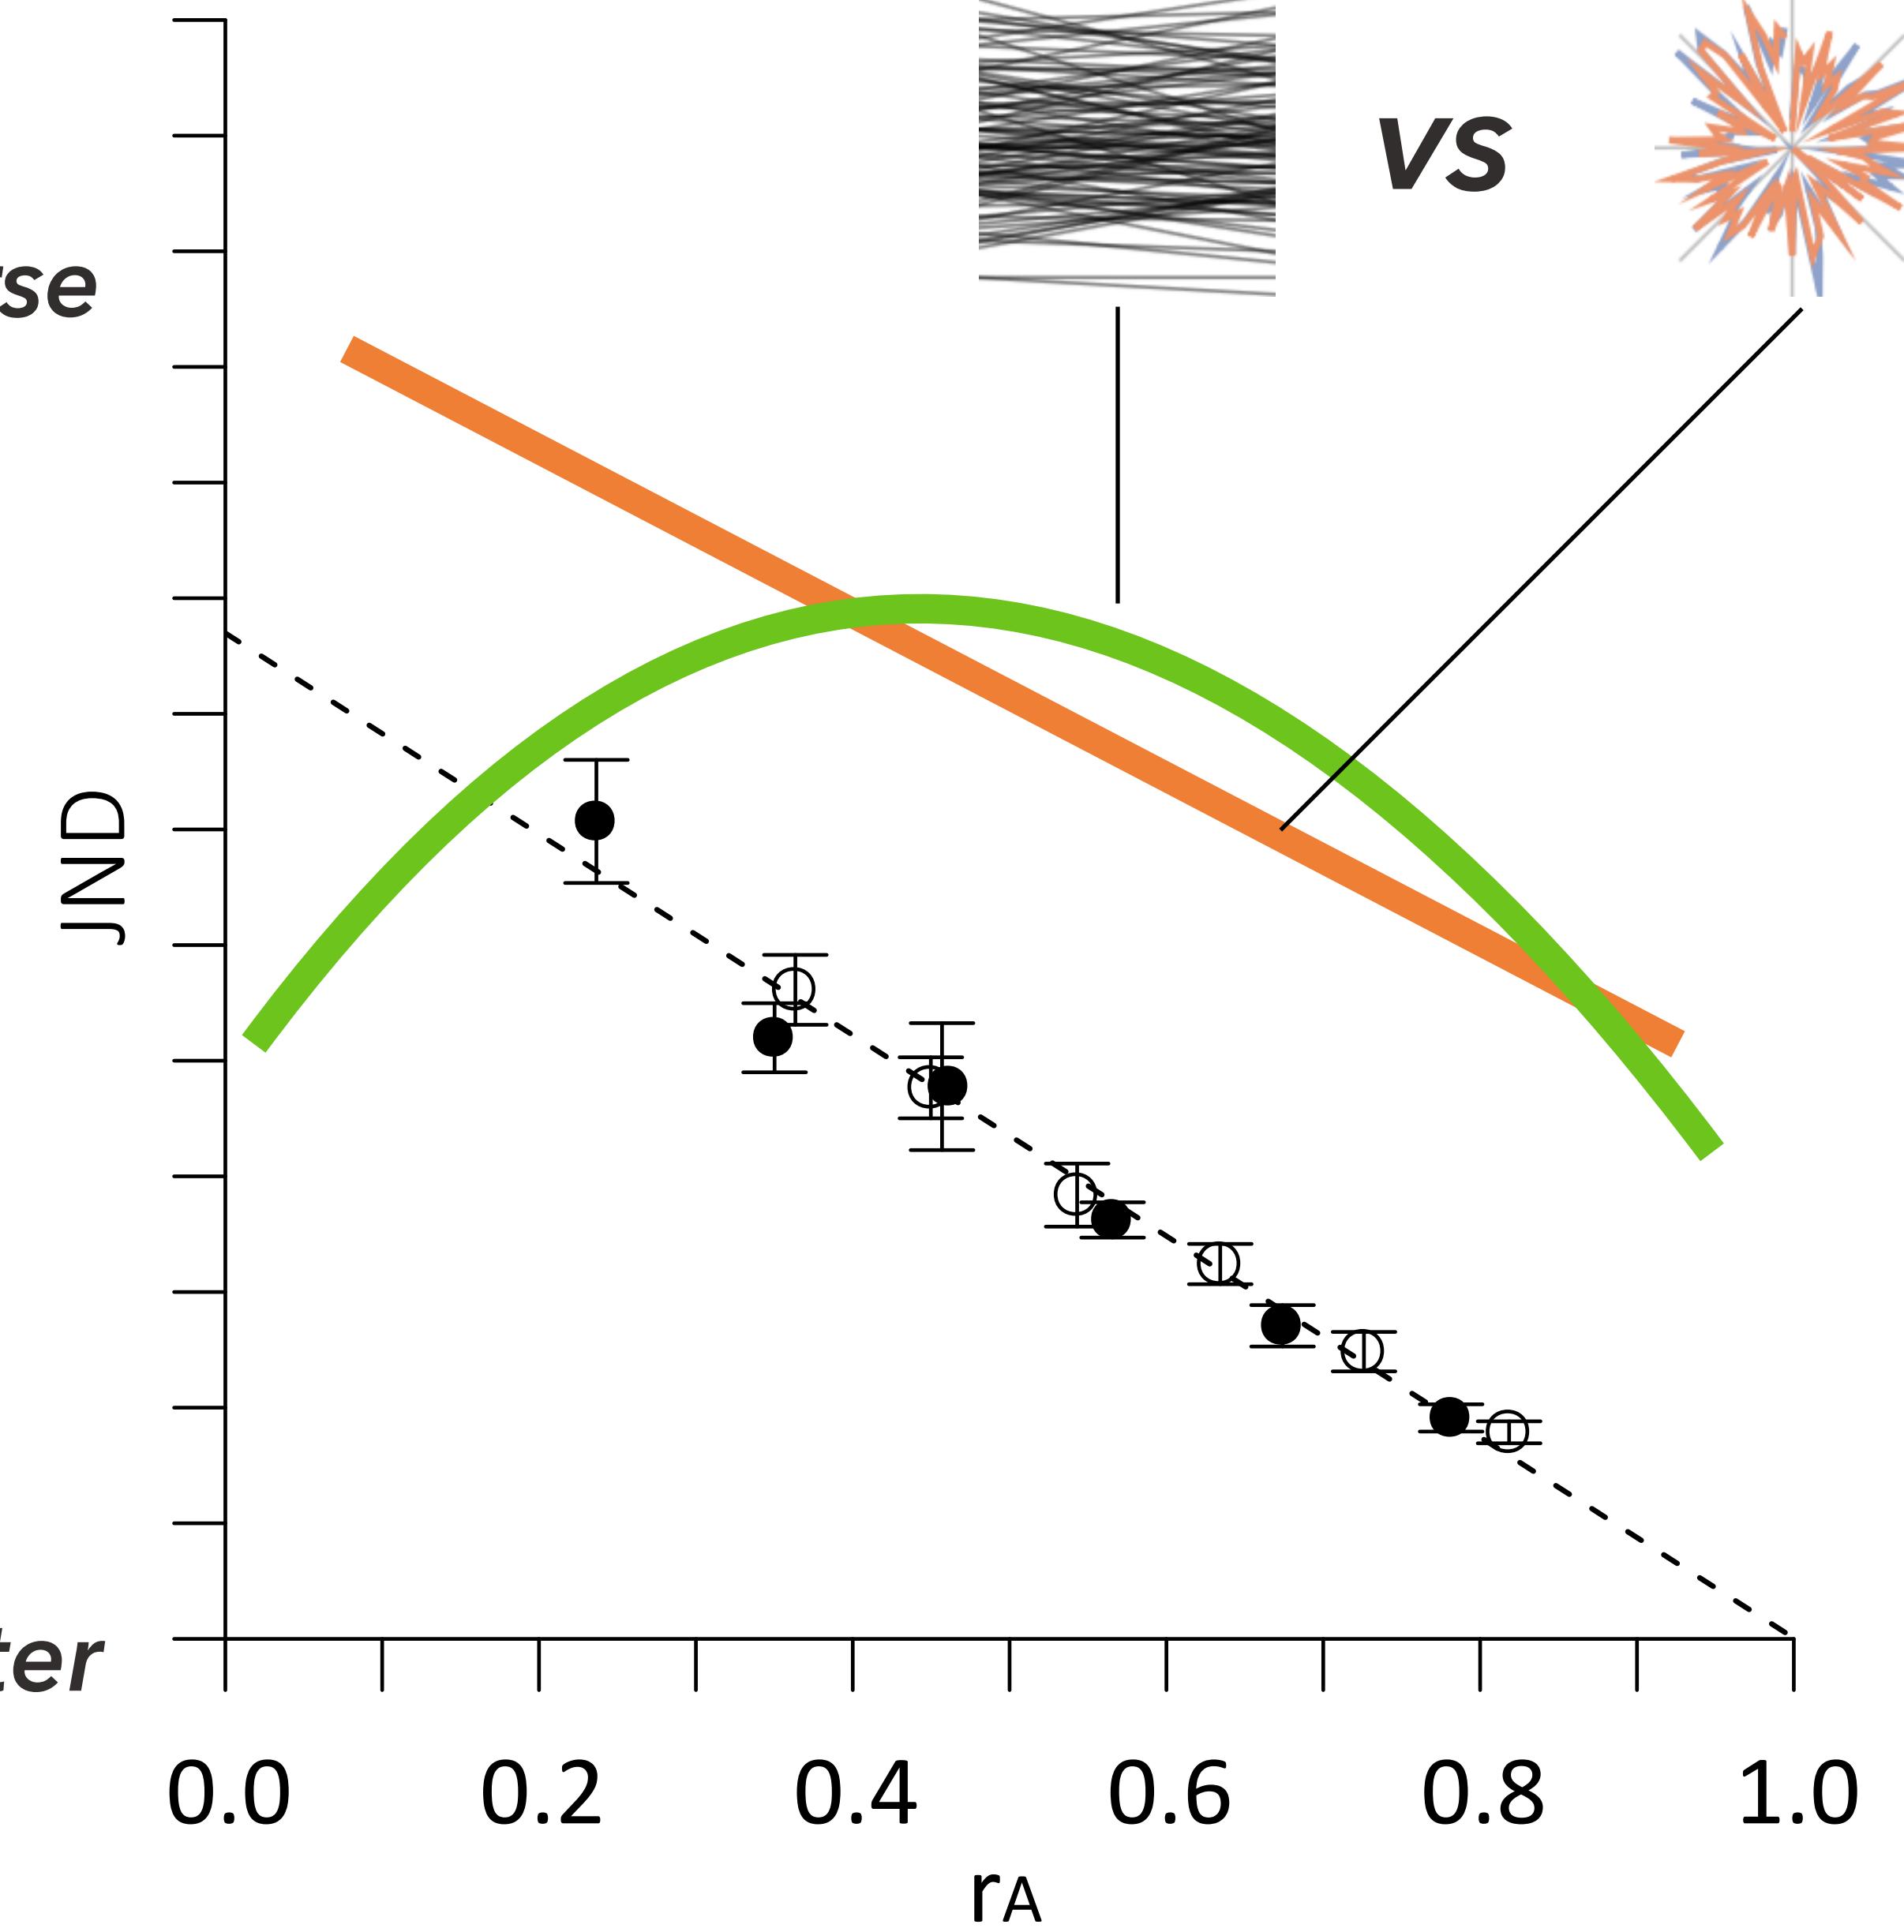

better

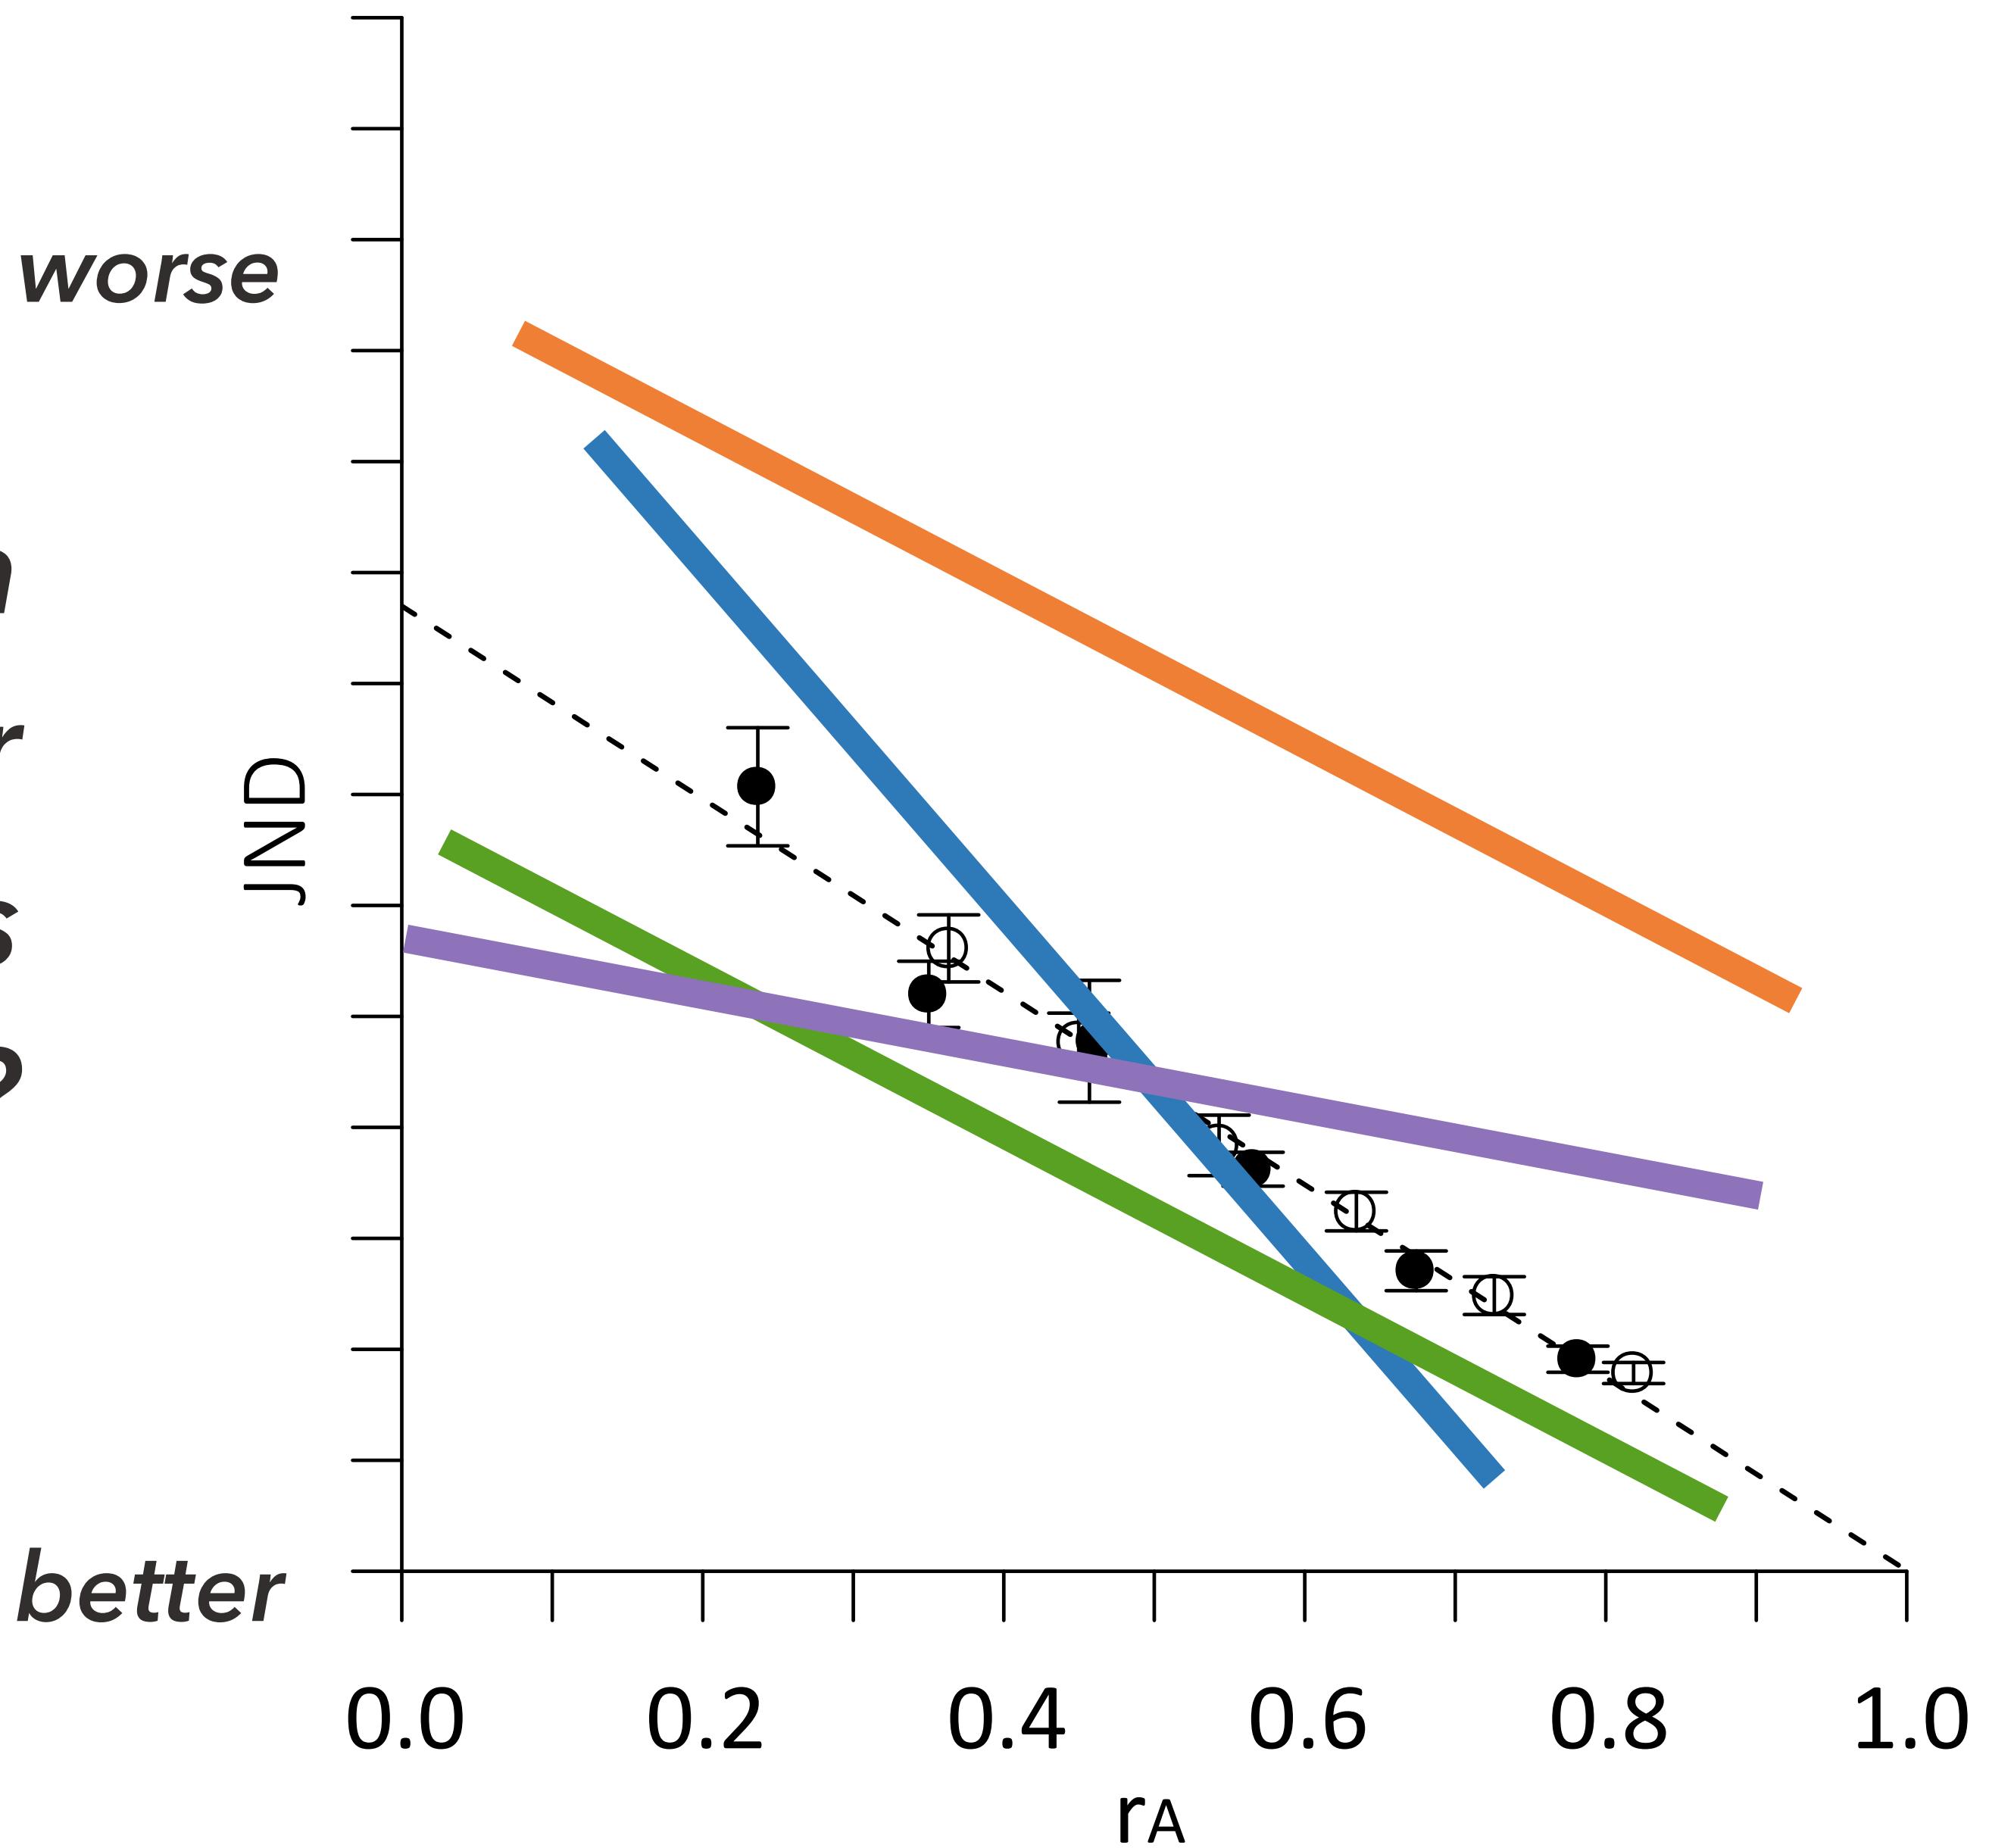

*What does the
perception of

Future Work

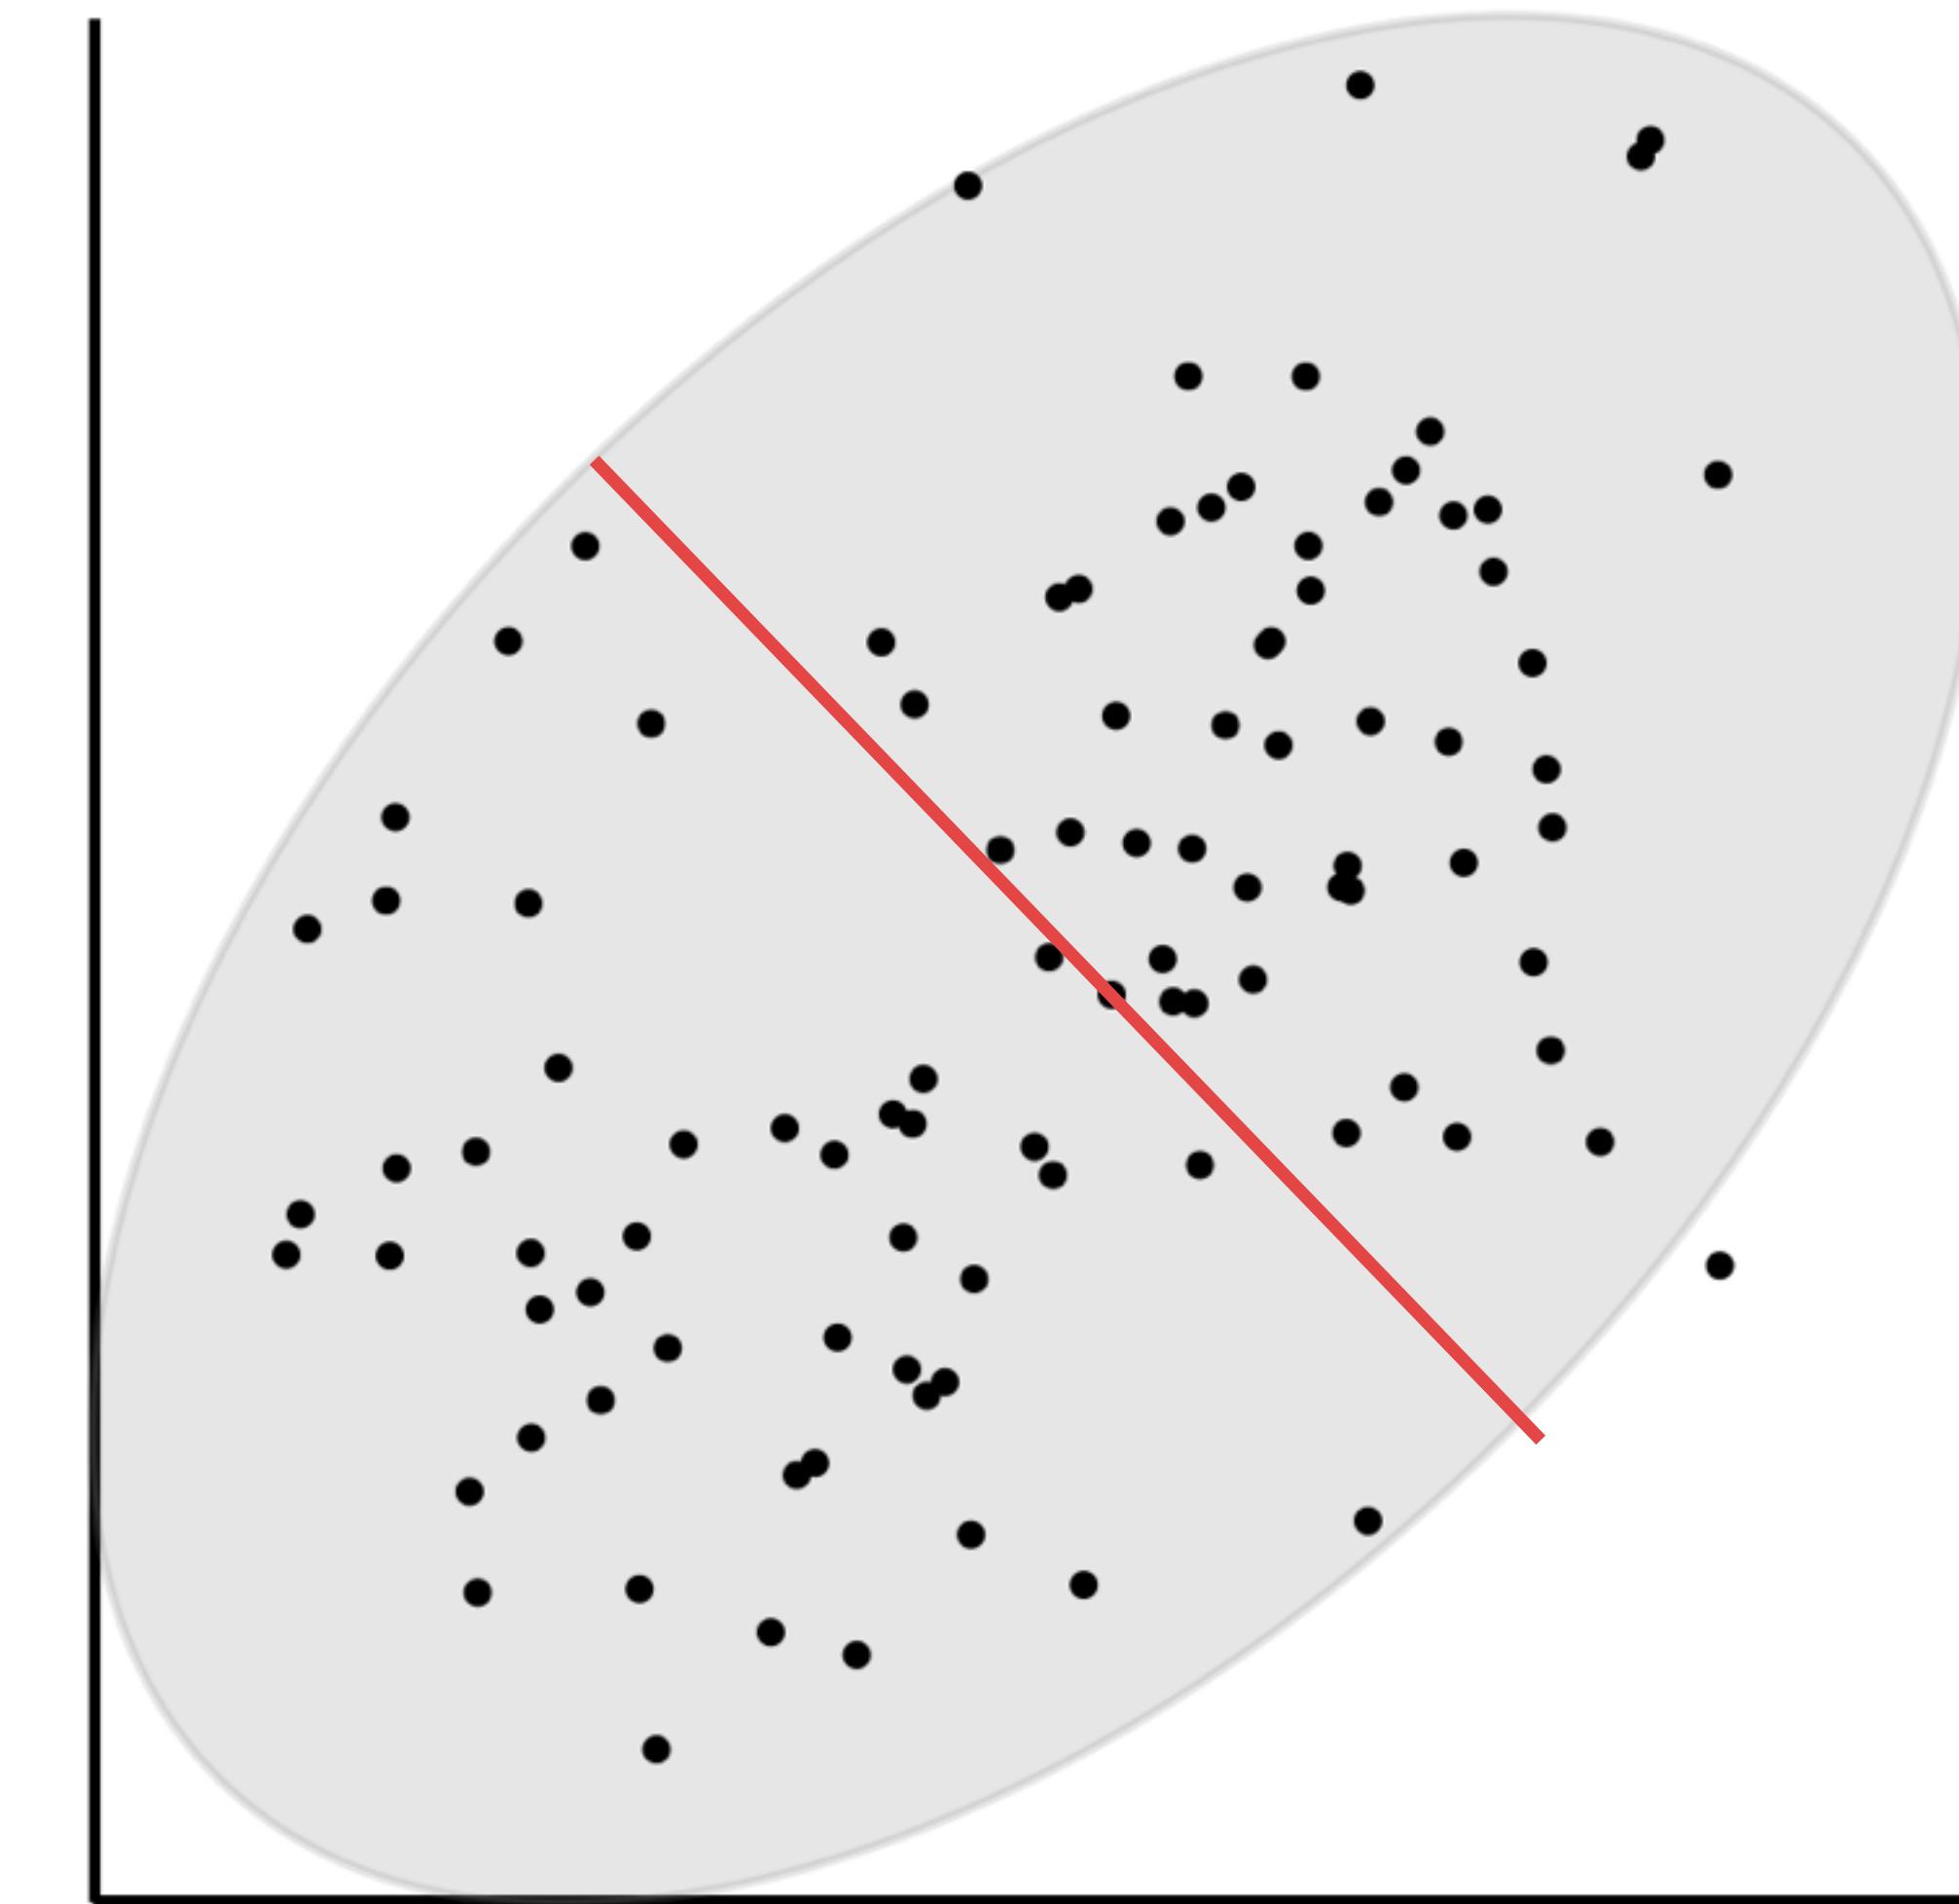

*Why does Weber's law, which
typically applies to low-level
aspects of perception, work
so well for modeling
correlation?*

*conj: People aren't
perceiving correlation,
but the visual features
related to correlation.*

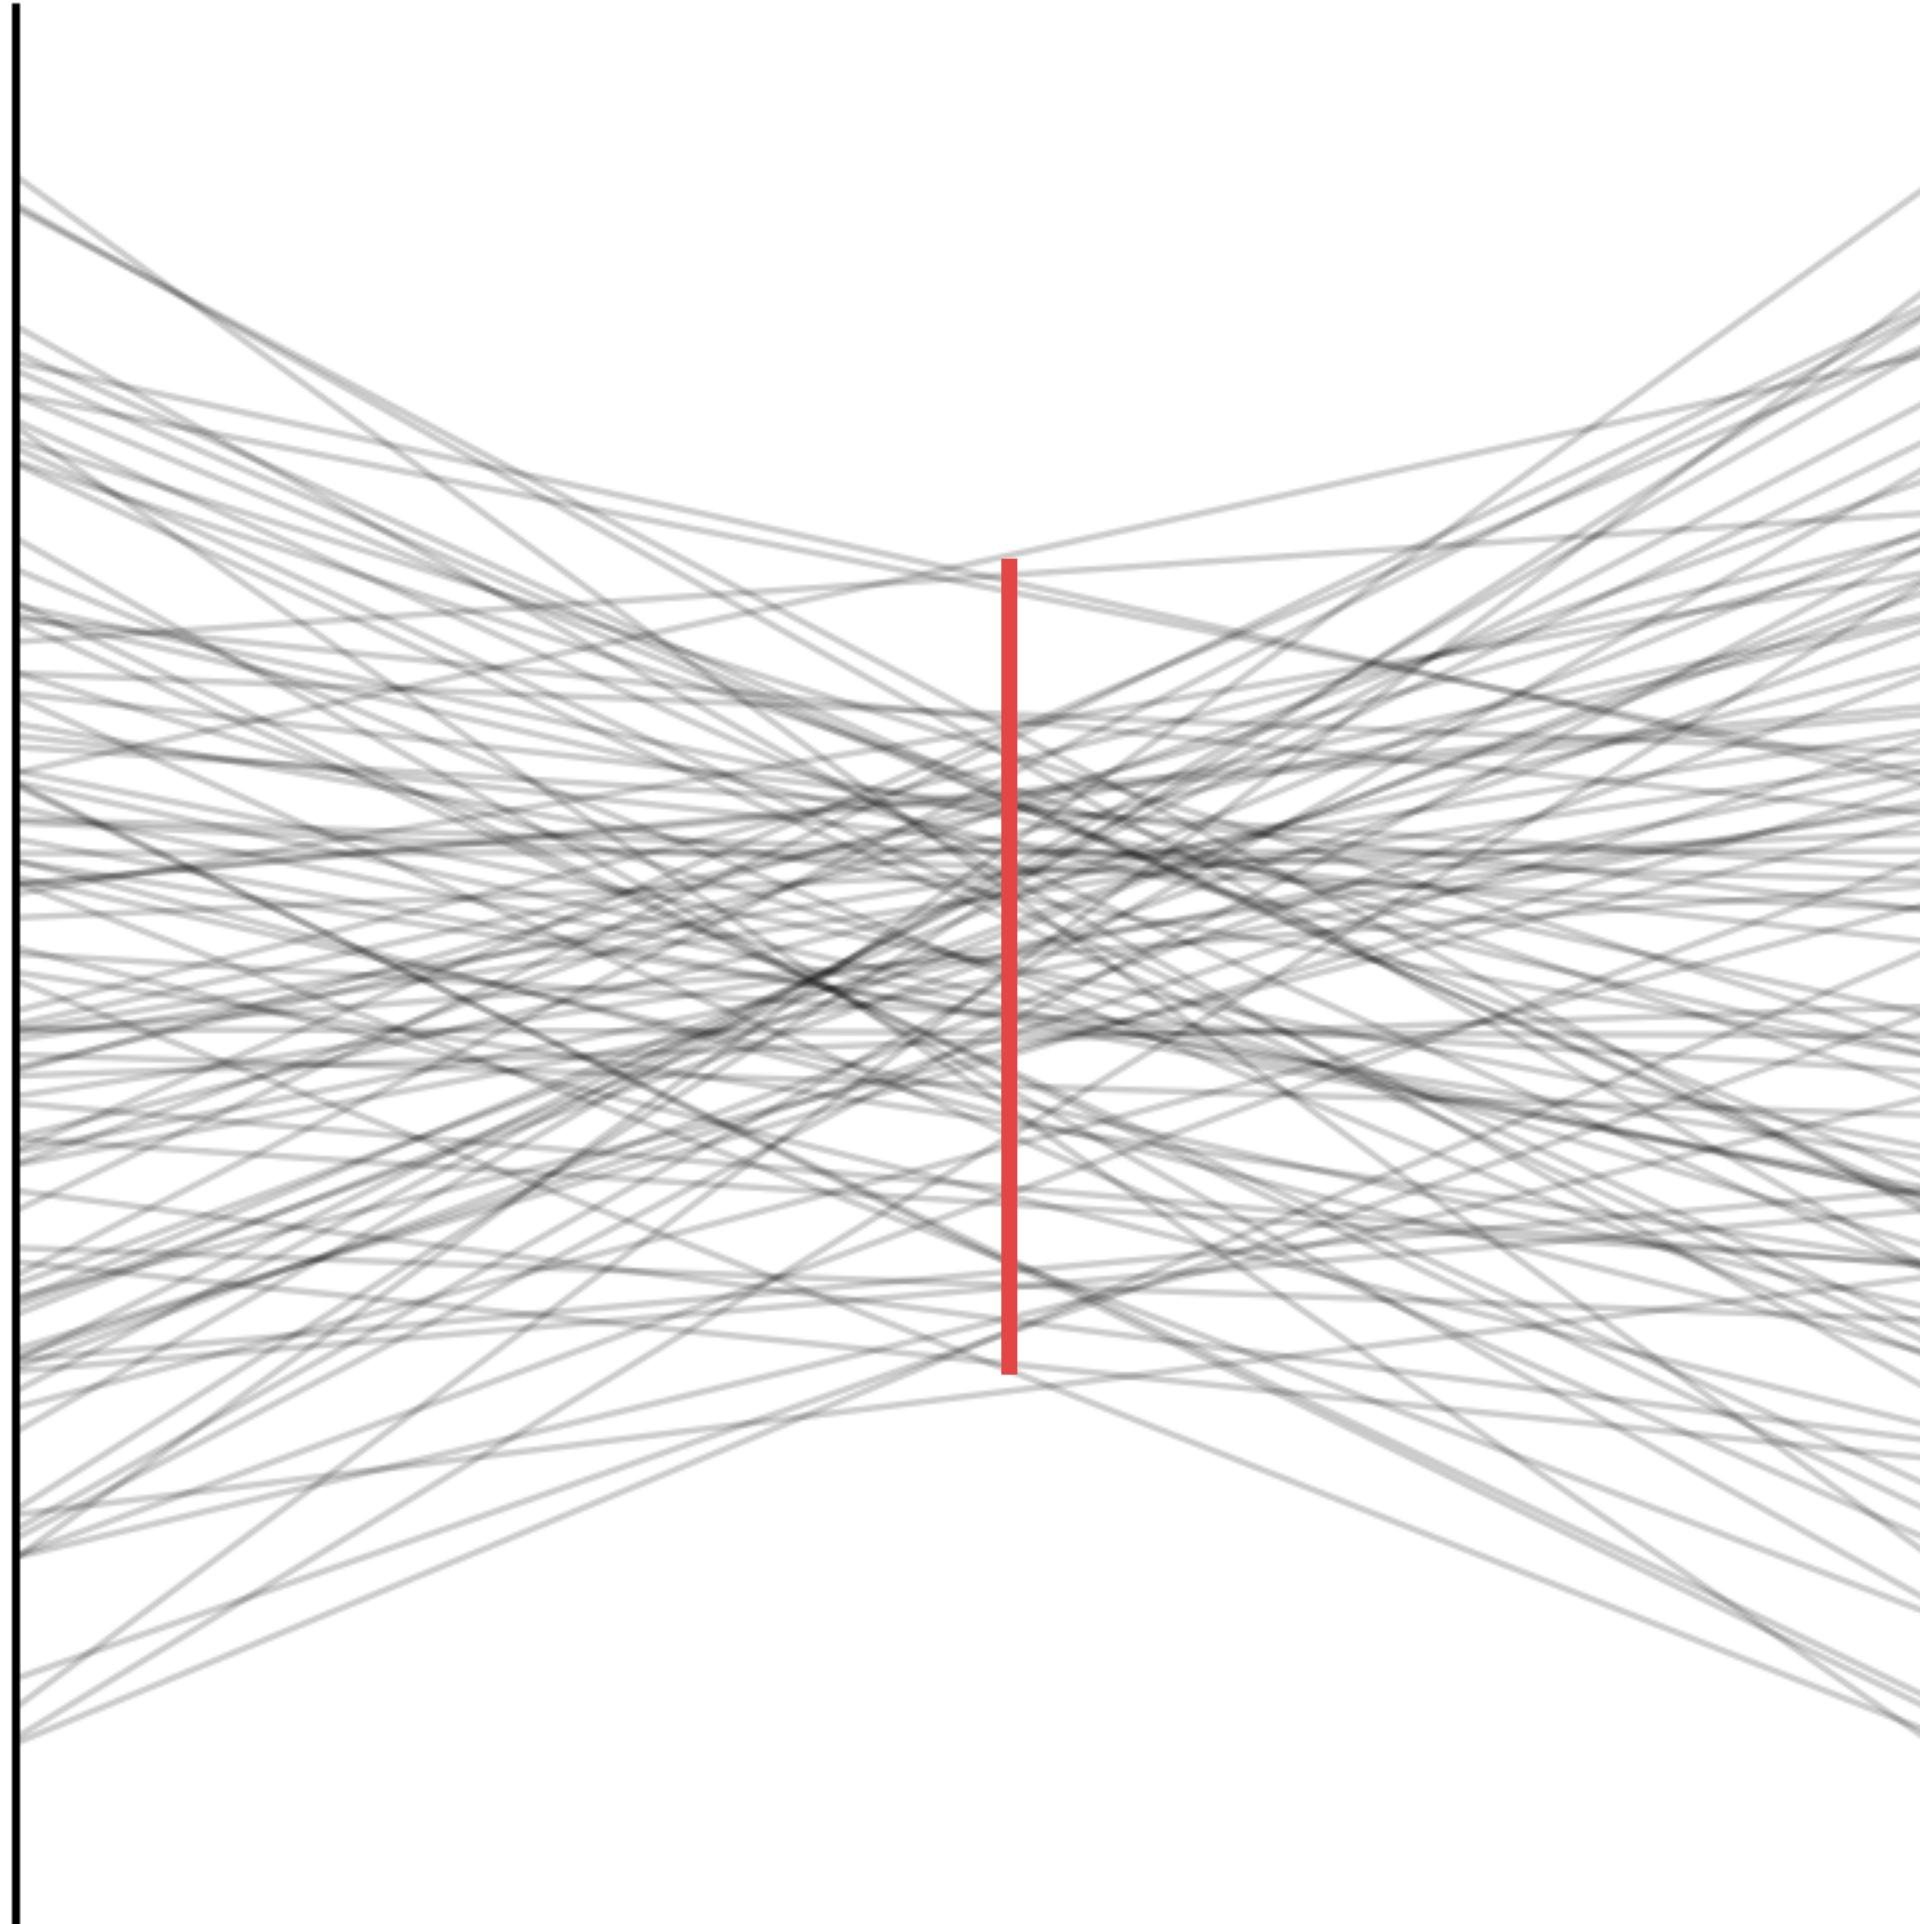

$r = 0.8$

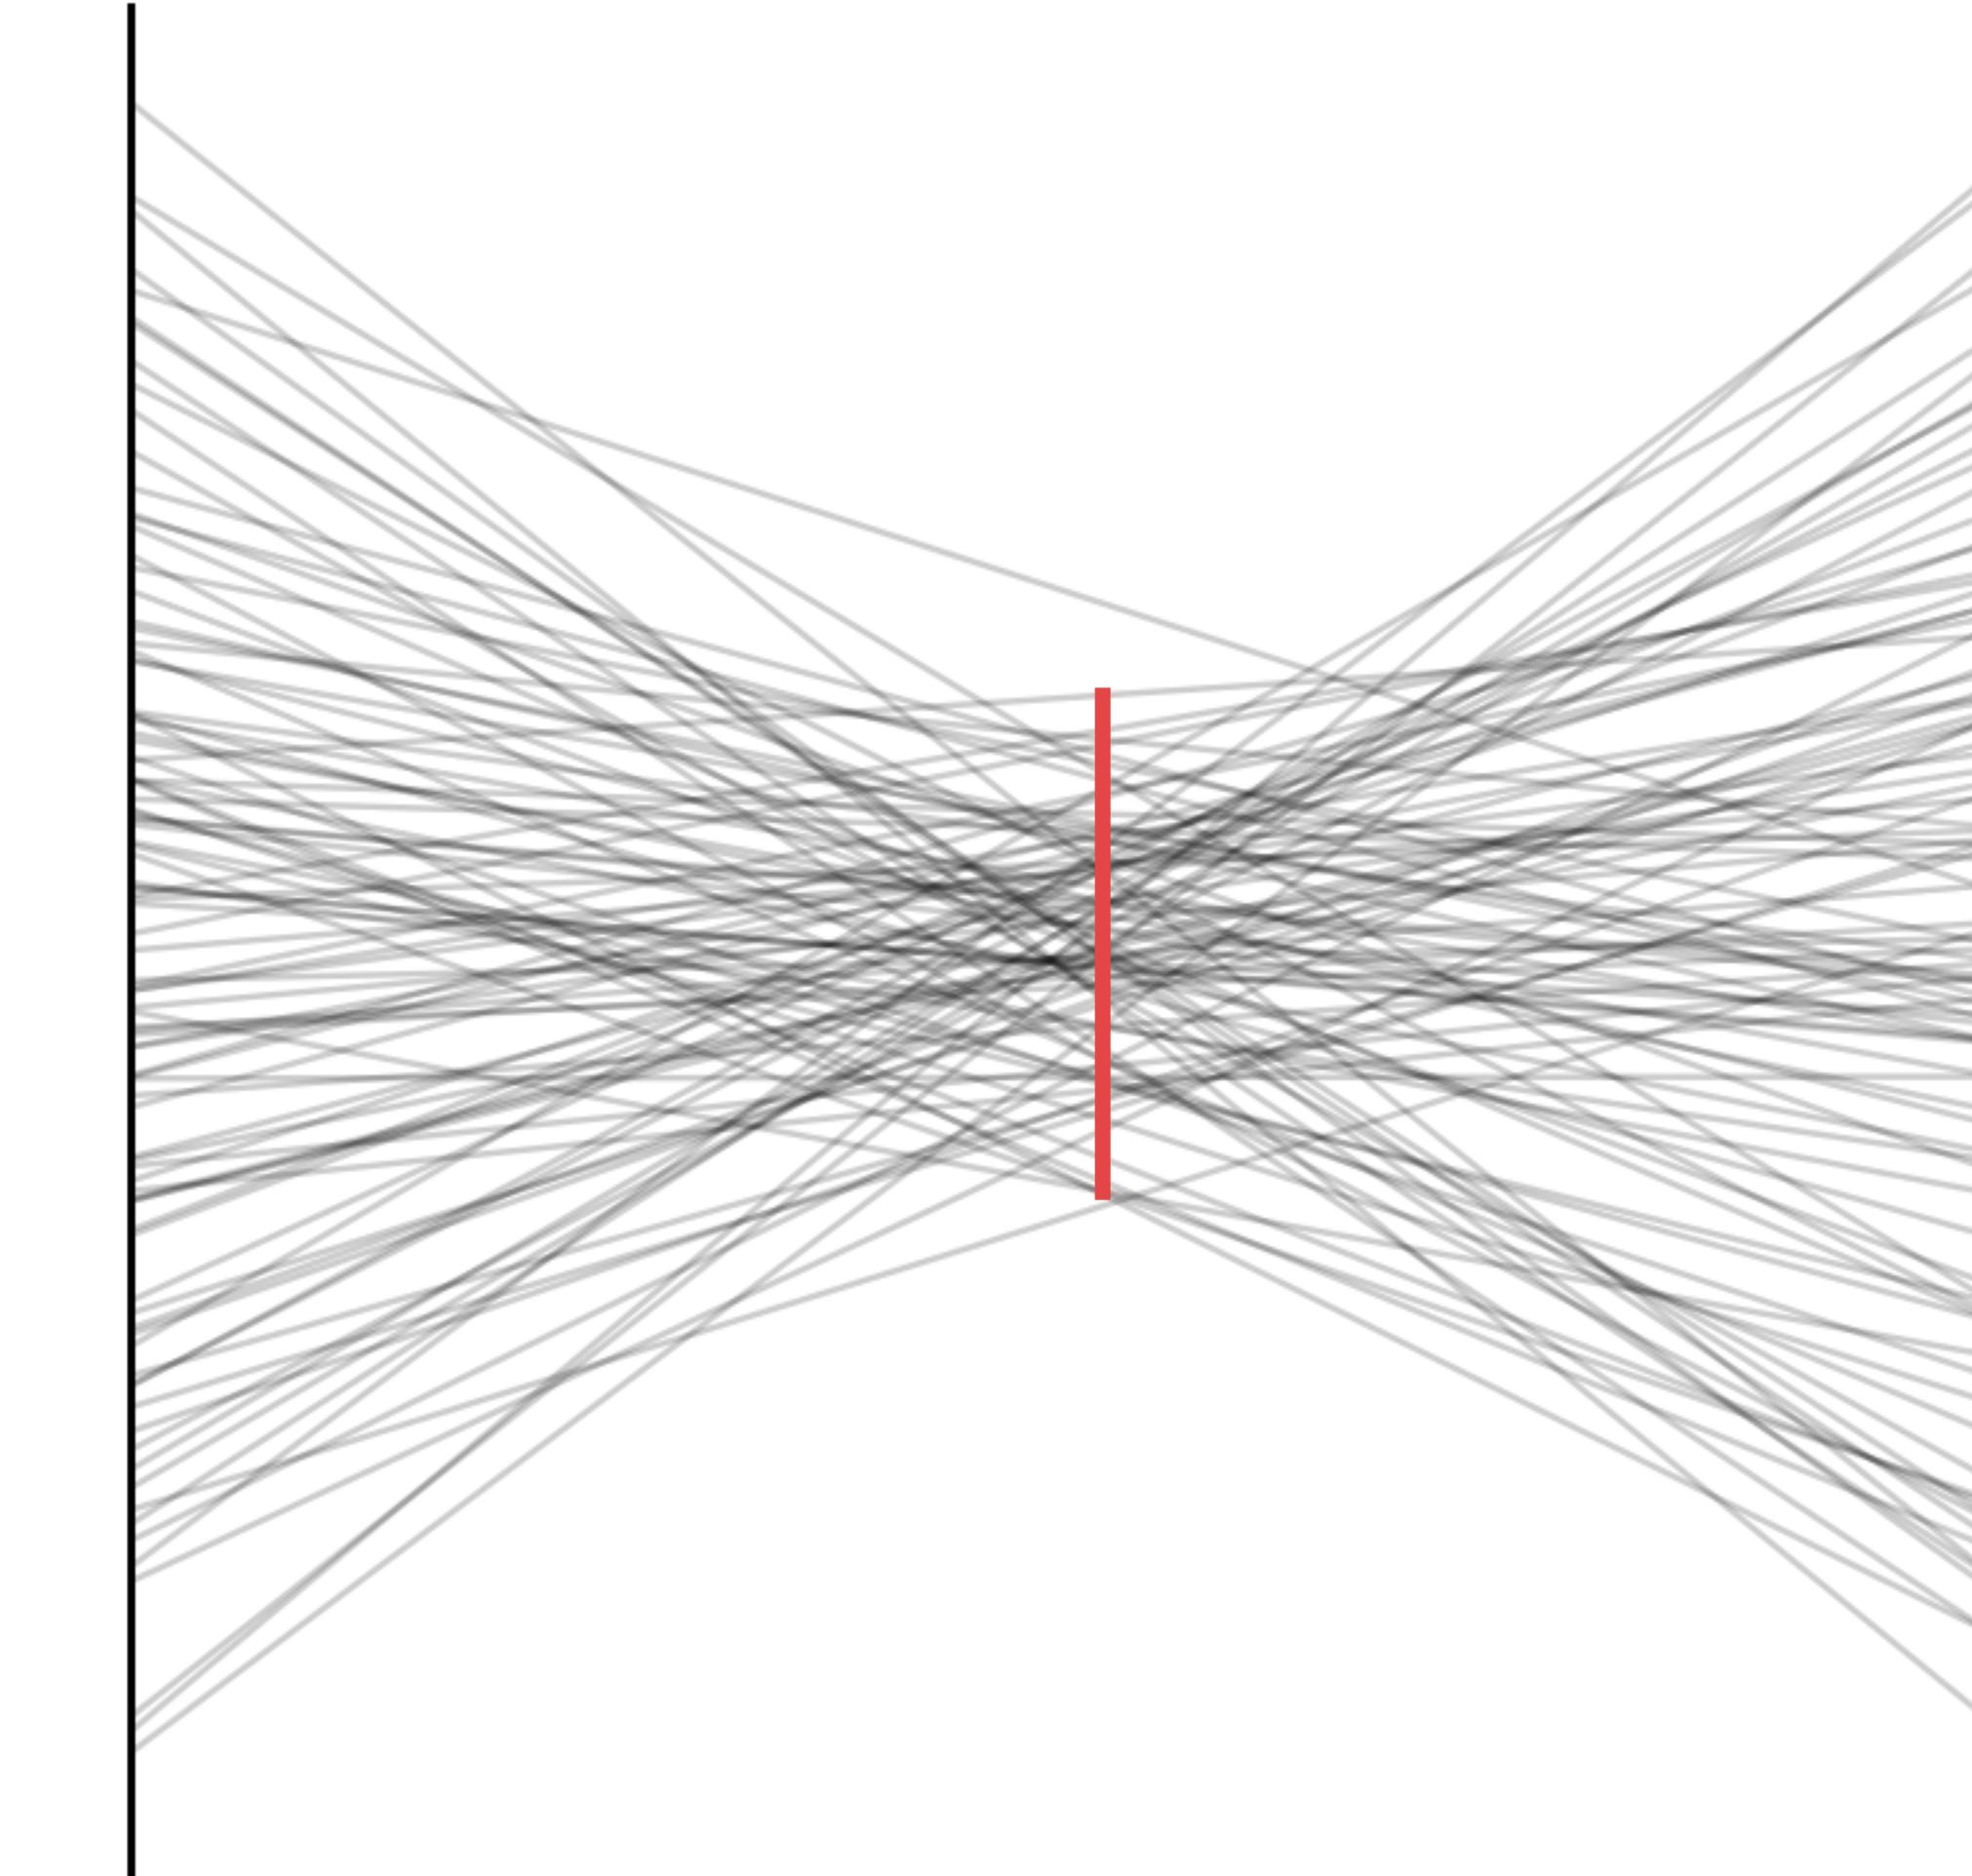

$r = 0.5$

$r = -0.8$

$r = -0.5$

To summarize:

*Theory-grounded models help build
the science of visualization while
providing actionable information to
inform visualization design.*

Lane Harrison (lane@cs.tufts.edu)

A 12x6 grid heatmap showing the correlation between 12 visualization types across six r values. The y-axis is labeled "better" with an upward arrow. The x-axis has labels $r = 0.1 *$, $r = 0.3$, $r = 0.5$, $r = 0.7$, $r = 0.9 *$, and overall.
